
Welcome to E-XFL.COM

Understanding Embedded - DSP (Digital Signal Processors)

Embedded - DSP (Digital Signal Processors) are specialized microprocessors designed to perform complex mathematical computations on digital signals in real-time. Unlike general-purpose processors, DSPs are optimized for high-speed numeric processing tasks, making them ideal for applications that require efficient and precise manipulation of digital data. These processors are fundamental in converting and processing signals in various forms, including audio, video, and communication signals, ensuring that data is accurately interpreted and utilized in embedded systems.

Applications of Embedded - DSP (Digital Signal Processors)

Details	
Product Status	Active
Type	Blackfin+
Interface	CAN, DSPI, EBI/EMI, I²C, PPI, QSPI, SD/SDIO, SPI, SPORT, UART/USART, USB OTG
Clock Rate	300MHz
Non-Volatile Memory	ROM (512kB)
On-Chip RAM	1MB
Voltage - I/O	1.8V, 3.3V
Voltage - Core	1.10V
Operating Temperature	0°C ~ 70°C (TA)
Mounting Type	Surface Mount
Package / Case	88-VFQFN Exposed Pad, CSP
Supplier Device Package	88-LFCSP-VQ (12x12)
Purchase URL	https://www.e-xfl.com/product-detail/analog-devices/adsp-bf706kcpz-3

system event or fault if enabled. ECC protection is fully transparent to the user, even if L2 memory is read or written by 8-bit or 16-bit entities.

CRC-Protected Memories

While parity bit and ECC protection mainly protect against random soft errors in L1 and L2 memory cells, the CRC engines can be used to protect against systematic errors (pointer errors) and static content (instruction code) of L1, L2, and even L3 memories (DDR2, LPDDR). The processor features two CRC engines which are embedded in the memory-to-memory DMA controllers. CRC checksums can be calculated or compared on the fly during memory transfers, or one or multiple memory regions can be continuously scrubbed by a single DMA work unit as per DMA descriptor chain instructions. The CRC engine also protects data loaded during the boot process.

Memory Protection

The Blackfin+ core features a memory protection concept, which grants data and/or instruction accesses to enabled memory regions only. A supervisor mode vs. user mode programming model supports dynamically varying access rights. Increased flexibility in memory page size options supports a simple method of static memory partitioning.

System Protection

The system protection unit (SPU) guards against accidental or unwanted access to the MMR space of a peripheral by providing a write-protection mechanism. The user is able to choose and configure the peripherals that are protected as well as configure which ones of the four system MMR masters (core, memory DMA, the SPI host port, and Coresight debug) the peripherals are guarded against.

The SPU is also part of the security infrastructure. Along with providing write-protection functionality, the SPU is employed to define which resources in the system are secure or non-secure and to block access to secure resources from non-secure masters.

Synonymously, the system memory protection unit (SMPU) provides memory protection against read and/or write transactions to defined regions of memory. There are two SMPU units in the ADSP-BF70x processors. One is for the L2 memory and the other is for the external DDR memory.

The SMPU is also part of the security infrastructure. It allows the user to not only protect against arbitrary read and/or write transactions, but it also allows regions of memory to be defined as secure and prevent non-secure masters from accessing those memory regions.

Watchpoint Protection

The primary purpose of watchpoints and hardware breakpoints is to serve emulator needs. When enabled, they signal an emulator event whenever user-defined system resources are accessed or the core executes from user-defined addresses. Watchpoint events can be configured such that they signal the events to the fault management unit of the SEC.

Watchdog

The on-chip software watchdog timer can supervise the Blackfin+ core.

Bandwidth Monitor

Memory-to-memory DMA channels are equipped with a bandwidth monitor mechanism. They can signal a system event or fault when transactions tend to starve because system buses are fully loaded with higher-priority traffic.

Signal Watchdogs

The eight general-purpose timers feature modes to monitor off-chip signals. The watchdog period mode monitors whether external signals toggle with a period within an expected range. The watchdog width mode monitors whether the pulse widths of external signals are within an expected range. Both modes help to detect undesired toggling (or lack thereof) of system-level signals.

Up/Down Count Mismatch Detection

The GP counter can monitor external signal pairs, such as request/grant strobes. If the edge count mismatch exceeds the expected range, the GP counter can flag this to the processor or to the fault management unit of the SEC.

Fault Management

The fault management unit is part of the system event controller (SEC). Any system event, whether a dual-bit uncorrectable ECC error, or any peripheral status interrupt, can be defined as being a fault. Additionally, the system events can be defined as an interrupt to the core. If defined as such, the SEC forwards the event to the fault management unit, which may automatically reset the entire device for reboot, or simply toggle the $\overline{\text{SYS\_FAULT}}$ output pin to signal off-chip hardware. Optionally, the fault management unit can delay the action taken through a keyed sequence, to provide a final chance for the Blackfin+ core to resolve the issue and to prevent the fault action from being taken.

ADDITIONAL PROCESSOR PERIPHERALS

The processor contains a rich set of peripherals connected to the core through several high-bandwidth buses, providing flexibility in system configuration as well as excellent overall system performance (see the block diagram on Page 1). The processor contains high-speed serial and parallel ports, an interrupt controller for flexible management of interrupts from the on-chip peripherals or external sources, and power management control functions to tailor the performance and power characteristics of the processor and system to many application scenarios.

The following sections describe additional peripherals that were not previously described.

Timers

The processor includes several timers which are described in the following sections.

General-Purpose Timers

There is one GP timer unit, and it provides eight general-purpose programmable timers. Each timer has an external pin that can be configured either as a pulse width modulator (PWM) or timer output, as an input to clock the timer, or as a mechanism for measuring pulse widths and periods of external events. These timers can be synchronized to an external clock input on the TIMER_TMRx pins, an external TIMER_CLK input pin, or to the internal SCLK0.

These timer units can be used in conjunction with the UARTs and the CAN controller to measure the width of the pulses in the data stream to provide a software auto-baud detect function for the respective serial channels.

The GP timers can generate interrupts to the processor core, providing periodic events for synchronization to either the system clock or to external signals. Timer events can also trigger other peripherals through the TRU (for instance, to signal a fault). Each timer may also be started and/or stopped by any TRU master without core intervention.

Core Timer

The processor core also has its own dedicated timer. This extra timer is clocked by the internal processor clock and is typically used as a system tick clock for generating periodic operating system interrupts.

Watchdog Timer

The core includes a 32-bit timer, which may be used to implement a software watchdog function. A software watchdog can improve system availability by forcing the processor to a known state, through generation of a hardware reset, nonmaskable interrupt (NMI), or general-purpose interrupt, if the timer expires before being reset by software. The programmer initializes the count value of the timer, enables the appropriate interrupt, then enables the timer. Thereafter, the software must reload the counter before it counts down to zero from the programmed value. This protects the system from remaining in an unknown state where software that would normally reset the timer has stopped running due to an external noise condition or software error.

After a reset, software can determine if the watchdog was the source of the hardware reset by interrogating a status bit in its timer control register that is set only upon a watchdog-generated reset.

Serial Ports (SPORTs)

Two synchronous serial ports (comprised of four half-SPORTs) provide an inexpensive interface to a wide variety of digital and mixed-signal peripheral devices such as Analog Devices' audio codecs, ADCs, and DACs. Each half-SPORT is made up of two data lines, a clock, and frame sync. The data lines can be programmed to either transmit or receive and each data line has a dedicated DMA channel.

Serial port data can be automatically transferred to and from on-chip memory/external memory through dedicated DMA channels. Each of the serial ports can work in conjunction with another serial port to provide TDM support. In this configuration, one SPORT provides two transmit signals while the other SPORT provides the two receive signals. The frame sync and clock are shared.

Serial ports operate in six modes:

- Standard DSP serial mode
- Multichannel (TDM) mode
- I^2S mode
- Packed I^2S mode
- Left-justified mode
- Right-justified mode

General-Purpose Counters

A 32-bit counter is provided that can operate in general-purpose up/down count modes and can sense 2-bit quadrature or binary codes as typically emitted by industrial drives or manual thumbwheels. Count direction is either controlled by a level-sensitive input pin or by two edge detectors.

A third counter input can provide flexible zero marker support and can alternatively be used to input the push-button signal of thumbwheel devices. All three pins have a programmable debouncing circuit.

Internal signals forwarded to a GP timer enable this timer to measure the intervals between count events. Boundary registers enable auto-zero operation or simple system warning by interrupts when programmed count values are exceeded.

Parallel Peripheral Interface (PPI)

The processor provides a parallel peripheral interface (PPI) that supports data widths up to 18 bits. The PPI supports direct connection to TFT LCD panels, parallel analog-to-digital and digital-to-analog converters, video encoders and decoders, image sensor modules, and other general-purpose peripherals.

The following features are supported in the PPI module:

- Programmable data length: 8 bits, 10 bits, 12 bits, 14 bits, 16 bits, and 18 bits per clock.
- Various framed, non-framed, and general-purpose operating modes. Frame syncs can be generated internally or can be supplied by an external device.
- ITU-656 status word error detection and correction for ITU-656 receive modes and ITU-656 preamble and status word decode.
- Optional packing and unpacking of data to/from 32 bits from/to 8 bits, 16 bits and 24 bits. If packing/unpacking is enabled, endianness can be configured to change the order of packing/unpacking of bytes/words.
- RGB888 can be converted to RGB666 or RGB565 for transmit modes.
- Various de-interleaving/interleaving modes for receiving/transmitting 4:2:2 YCrCb data.
- Configurable LCD data enable (DEN) output available on Frame Sync 3.

Table 3. Clock Dividers

Clock Source	Divider (if Available on SYS_CLKOUT)
CCLK (Core Clock)	By 16
SYSCLK (System Clock)	By 8
SCLK0 (System Clock, All Peripherals not Covered by SCLK1)	Not available on SYS_CLKOUT
SCLK1 (System Clock for Crypto Engines and MDMA)	By 8
DCLK (LPDDR/DDR2 Clock)	By 8
OCLK (Output Clock)	Programmable
CLKBUF	None, direct from SYS_CLKIN

Power Management

As shown in Table 4, the processor supports multiple power domains, which maximizes flexibility while maintaining compliance with industry standards and conventions. There are no sequencing requirements for the various power domains, but all domains must be powered according to the appropriate Specifications table for processor operating conditions; even if the feature/peripheral is not used.

Table 4. Power Domains

Power Domain	V_{DD} Range
All Internal Logic	V_{DD_INT}
DDR2/LPDDR	V_{DD_DMC}
USB	V_{DD_USB}
OTP Memory	V_{DD_OTP}
HADC	V_{DD_HADC}
RTC	V_{DD_RTC}
All Other I/O (Includes SYS, JTAG, and Ports Pins)	V_{DD_EXT}

The dynamic power management feature of the processor allows the processor's core clock frequency (f_{CCLK}) to be dynamically controlled.

The power dissipated by a processor is largely a function of its clock frequency and the square of the operating voltage. For example, reducing the clock frequency by 25% results in a 25% reduction in dynamic power dissipation.

See Table 5 for a summary of the power settings for each mode.

Full-On Operating Mode—Maximum Performance

In the full-on mode, the PLL is enabled and is not bypassed, providing capability for maximum operational frequency. This is the power-up default execution state in which maximum performance can be achieved. The processor core and all enabled peripherals run at full speed.

Deep Sleep Operating Mode—Maximum Dynamic Power Savings

The deep sleep mode maximizes dynamic power savings by disabling the clocks to the processor core and to all synchronous peripherals. Asynchronous peripherals may still be running but cannot access internal resources or external memory.

Table 5. Power Settings

Mode/State	PLL	PLL Bypassed	f_{CCLK}	f_{SYSCLK}, f_{DCLK}, f_{SCLK0}, f_{SCLK1}	Core Power
Full On	Enabled	No	Enabled	Enabled	On
Deep Sleep	Disabled	—	Disabled	Disabled	On
Hibernate	Disabled	—	Disabled	Disabled	Off

Hibernate State—Maximum Static Power Savings

The hibernate state maximizes static power savings by disabling the voltage and clocks to the processor core and to all of the peripherals. This setting signals the external voltage regulator supplying the VDD_INT pins to shut off using the SYS_EXTWAKE signal, which provides the lowest static power dissipation.

Any critical information stored internally (for example, memory contents, register contents, and other information) must be written to a nonvolatile storage device (or self-refreshed DRAM) prior to removing power if the processor state is to be preserved.

Because the V_{DD_EXT} pins can still be supplied in this mode, all of the external pins three-state, unless otherwise specified. This allows other devices that may be connected to the processor to still have power applied without drawing unwanted current.

Reset Control Unit

Reset is the initial state of the whole processor or the core and is the result of a hardware- or software-triggered event. In this state, all control registers are set to their default values and functional units are idle. Exiting a full system reset starts with the core being ready to boot.

The reset control unit (RCU) controls how all the functional units enter and exit reset. Differences in functional requirements and clocking constraints define how reset signals are generated. Programs must guarantee that none of the reset functions puts the system into an undefined state or causes resources to stall. This is particularly important when the core is reset (programs must ensure that there is no pending system activity involving the core when it is being reset).

From a system perspective, reset is defined by both the reset target and the reset source described as follows in the following list.

Target defined:

- Hardware Reset—All functional units are set to their default states without exception. History is lost.
- System Reset—All functional units except the RCU are set to their default states.
- Core-only Reset—Affects the core only. The system software should guarantee that the core, while in reset state, is not accessed by any bus master.

Source defined:

- Hardware Reset—The $\overline{\text{SYS\_HWRST}}$ input signal is asserted active (pulled down).
- System Reset—May be triggered by software (writing to the RCU_CTL register) or by another functional unit such as the dynamic power management (DPM) unit (hibernate) or any of the system event controller (SEC), trigger routing unit (TRU), or emulator inputs.
- Core-only Reset—Triggered by software.
- Trigger request (peripheral).

Voltage Regulation

The processor requires an external voltage regulator to power the VDD_INT pins. To reduce standby power consumption, the external voltage regulator can be signaled through SYS_EXTWAKE to remove power from the processor core. This signal is high-true for power-up and may be connected directly to the low-true shut-down input of many common regulators.

While in the hibernate state, all external supply pins (VDD_EXT, VDD_USB, and VDD_DMC) can still be powered, eliminating the need for external buffers. The external voltage regulator can be activated from this power down state by asserting the $\overline{\text{SYS\_HWRST}}$ pin, which then initiates a boot sequence. SYS_EXTWAKE indicates a wake-up to the external voltage regulator.

SYSTEM DEBUG

The processor includes various features that allow for easy system debug. These are described in the following sections.

System Watchpoint Unit

The system watchpoint unit (SWU) is a single module which connects to a single system bus and provides for transaction monitoring. One SWU is attached to the bus going to each system slave. The SWU provides ports for all system bus address channel signals. Each SWU contains four match groups of registers with associated hardware. These four SWU match groups operate independently, but share common event (interrupt, trigger, and others) outputs.

Debug Access Port

The debug access port (DAP) provides IEEE-1149.1 JTAG interface support through its JTAG debug and serial wire debug port (SWJ-DP). SWJ-DP is a combined JTAG-DP and SW-DP that enables either serial wire debug (SWD) or a JTAG emulator to be connected to a target. SWD signals share the same pins as JTAG. The DAP provides an optional instrumentation trace for both the core and system. It provides a trace stream that conforms to MIPI System Trace Protocol version 2 (STPv2).

DEVELOPMENT TOOLS

Analog Devices supports its processors with a complete line of software and hardware development tools, including integrated development environments (CrossCore® Embedded Studio), evaluation products, emulators, and a wide variety of software add-ins.

Integrated Development Environments (IDEs)

CrossCore Embedded Studio is based on the Eclipse™ framework. Supporting most Analog Devices processor families, it is the IDE of choice for future processors, including multicore devices. CrossCore Embedded Studio seamlessly integrates available software add-ins to support real time operating systems, file systems, TCP/IP stacks, USB stacks, algorithmic software modules, and evaluation hardware board support packages. For more information, visit www.analog.com/cces.

EZ-KIT Lite Evaluation Board

For processor evaluation, Analog Devices provides a wide range of EZ-KIT Lite® evaluation boards. Including the processor and key peripherals, the evaluation board also supports on-chip emulation capabilities and other evaluation and development features. Also available are various EZ-Extenders®, which are daughter cards delivering additional specialized functionality, including audio and video processing. For more information, visit www.analog.com and search on “ezkit” or “ezextender”.

EZ-KIT Lite Evaluation Kits

For a cost-effective way to learn more about developing with Analog Devices processors, Analog Devices offer a range of EZ-KIT Lite evaluation kits. Each evaluation kit includes an EZ-KIT Lite evaluation board, directions for downloading an evaluation version of the available IDE, a USB cable, and a power supply. The USB controller on the EZ-KIT Lite board connects to the USB port of the user’s PC, enabling the chosen IDE evaluation suite to emulate the on-board processor in-circuit. This permits the customer to download, execute, and debug programs for the EZ-KIT Lite system. It also supports in-circuit programming of the on-board Flash device to store user-specific boot code, enabling standalone operation. With the full version of CrossCore Embedded Studio installed (sold separately), engineers can develop software for supported EZ-KITs or any custom system utilizing supported Analog Devices processors.

ADSP-BF706 EZ-KIT Mini

The ADSP-BF706 EZ-KIT Mini™ product (ADZS-BF706-EZMini) contains the ADSP-BF706 processor and is shipped with all of the necessary hardware. Users can start their evaluation immediately. The EZ-KIT Mini product includes the standalone evaluation board and USB cable. The EZ-KIT Mini ships with an on-board debug agent.

The evaluation board is designed to be used in conjunction with the CrossCore Embedded Studio (CCES) development tools to test capabilities of the ADSP-BF706 Blackfin processor.

Table 6. ADSP-BF70x Detailed Signal Descriptions (Continued)

Port Name	Direction	Description
HADC_VREFN	Input	**Ground Reference for ADC.** Connect to an external voltage reference that meets data sheet specifications.
HADC_VREFP	Input	**External Reference for ADC.** Connect to an external voltage reference that meets data sheet specifications.
$\overline{\text{MSI\_CD}}$	Input	**Card Detect.** Connects to a pull-up resistor and to the card detect output of an SD socket.
MSI_CLK	Output	**Clock.** The clock signal applied to the connected device from the MSI.
MSI_CMD	I/O	**Command.** Used to send commands to and receive responses from the connected device.
MSI_Dn	I/O	**Data n.** Bidirectional data bus.
$\overline{\text{MSI\_INT}}$	Input	**eSDIO Interrupt Input.** Used only for eSDIO. Connects to an eSDIO card's interrupt output. An interrupt may be sampled even when the MSI clock to the card is switched off.
Px_nn	I/O	**Position n.** General purpose input/output. See the GP Ports chapter of the HRM for programming information.
RTC_CLKIN	Input	**Crystal input/external oscillator connection.** Connect to an external clock source or crystal.
RTC_XTAL	Output	**Crystal output.** Drives an external crystal. Must be left unconnected if an external clock is driving RTC_CLKIN.
$\overline{\text{SMC\_ABEn}}$	Output	**Byte Enable n.** Indicate whether the lower or upper byte of a memory is being accessed. When an asynchronous write is made to the upper byte of a 16-bit memory, SMC_ABE1b=0 and SMC_ABE0b=1. When an asynchronous write is made to the lower byte of a 16-bit memory, SMC_ABE1b=1 and SMC_ABE0b=0.
$\overline{\text{SMC\_AMSn}}$	Output	**Memory Select n.** Typically connects to the chip select of a memory device.
$\overline{\text{SMC\_AOE}}$	Output	**Output Enable.** Asserts at the beginning of the setup period of a read access.
SMC_ARDY	Input	**Asynchronous Ready.** Flow control signal used by memory devices to indicate to the SMC when further transactions may proceed.
$\overline{\text{SMC\_ARE}}$	Output	**Read Enable.** Asserts at the beginning of a read access.
$\overline{\text{SMC\_AWE}}$	Output	**Write Enable.** Asserts for the duration of a write access period.
SMC_Ann	Output	**Address n.** Address bus.
SMC_Dnn	I/O	**Data n.** Bidirectional data bus.
SPI_CLK	I/O	**Clock.** Input in slave mode, output in master mode.
SPI_D2	I/O	**Data 2.** Used to transfer serial data in Quad mode. Open-drain when ODM mode is enabled.
SPI_D3	I/O	**Data 3.** Used to transfer serial data in Quad mode. Open-drain when ODM mode is enabled.
SPI_MISO	I/O	**Master In, Slave Out.** Used to transfer serial data. Operates in the same direction as SPI_MOSI in Dual and Quad modes. Open-drain when ODM mode is enabled.
SPI_MOSI	I/O	**Master Out, Slave In.** Used to transfer serial data. Operates in the same direction as SPI_MISO in Dual and Quad modes. Open-drain when ODM mode is enabled.
SPI_RDY	I/O	**Ready.** Optional flow signal. Output in slave mode, input in master mode.
$\overline{\text{SPI\_SELn}}$	Output	**Slave Select Output n.** Used in Master mode to enable the desired slave.
$\overline{\text{SPI\_SS}}$	Input	**Slave Select Input.** Slave mode - Acts as the slave select input. Master mode- Optionally serves as an error detection input for the SPI when there are multiple masters.
SPT_ACLK	I/O	**Channel A Clock.** Data and Frame Sync are driven/sampled with respect to this clock. This signal can be either internally or externally generated.
SPT_AD0	I/O	**Channel A Data 0.** Primary bidirectional data I/O. This signal can be configured as an output to transmit serial data, or as an input to receive serial data.
SPT_AD1	I/O	**Channel A Data 1.** Secondary bidirectional data I/O. This signal can be configured as an output to transmit serial data, or as an input to receive serial data.
SPT_AFS	I/O	**Channel A Frame Sync.** The frame sync pulse initiates shifting of serial data. This signal is either generated internally or externally.
SPT_ATDV	Output	**Channel A Transmit Data Valid.** This signal is optional and only active when SPORT is configured in multichannel transmit mode. It is asserted during enabled slots.

184-BALL CSP_BGA SIGNAL DESCRIPTIONS

The processor's pin definitions are shown in Table 7. The columns in this table provide the following information:

- Signal Name: The Signal Name column in the table includes the signal name for every pin and (where applicable) the GPIO multiplexed pin function for every pin.
- Description: The Description column in the table provides a verbose (descriptive) name for the signal.
- General-Purpose Port: The Port column in the table shows whether or not the signal is multiplexed with other signals on a general-purpose I/O port pin.
- Pin Name: The Pin Name column in the table identifies the name of the package pin (at power on reset) on which the signal is located (if a single function pin) or is multiplexed (if a general-purpose I/O pin).

Table 7. ADSP-BF70x 184-Ball CSP_BGA Signal Descriptions

Signal Name	Description	Port	Pin Name
CAN0_RX	CAN0 Receive	C	PC_02
CAN0_TX	CAN0 Transmit	C	PC_03
CAN1_RX	CAN1 Receive	A	PA_12
CAN1_TX	CAN1 Transmit	A	PA_13
CNT0_DG	CNT0 Count Down and Gate	A	PA_07
CNT0_UD	CNT0 Count Up and Direction	A	PA_15
CNT0_ZM	CNT0 Count Zero Marker	A	PA_13

[1] Applies to all output and bidirectional signals except DMC0 signals, TWI signals, and USB0 signals.

[2] Applies to DMC0_Axx, DMC0_CAS, DMC0_CKE, DMC0_CK, DMC0_CK, DMC0_CS, DMC0_DQxx, DMC0_LDM, DMC0_LDQS, DMC0_LDQS, DMC0_ODT, DMC0_RAS, DMC0_UDM, DMC0_UDQS, DMC0_UDQS, and DMC0_WE signals.

[3] Applies to all output and bidirectional signals except DMC0 signals and USB0 signals.

[4] Applies to SMC0_ARDY, SYS_BMODEx, SYS_CLKIN, SYS_HWRST, JTG_TDI, and JTG_TMS_SWDIO signals.

[5] Applies to DMC0_VREF signal.

[6] Applies to JTG_TCK_SWCLK and JTG_TRST signals.

[7] Applies to SMC0_ARDY, SYS_BMODEx, SYS_CLKIN, SYS_HWRST, JTG_TCK, and JTG_TRST signals.

[8] Applies to JTG_TDI, JTG_TMS_SWDIO, PA_xx, PB_xx, and PC_xx signals when internal GPIO pull-ups are enabled. For information on when internal pull-ups are enabled for GPIOs. See ADSP-BF70x Designer Quick Reference on Page 38.

[9] Applies to USB0_CLKIN signal.

[10] Applies to PA_xx, PB_xx, PC_xx, SMC0_AMS0, SMC0_ARE, SMC0_AWE, SMC0_A0E, SMC0_Axx, SMC0_Dxx, SYS_FAULT, JTG_TDO_SWO, USB0_DM, USB0_DP, USB0_ID, and USB0_VBC signals.

[11] Applies to DMC0_Axx, DMC0_BAxx, DMC0_CAS, DMC0_CS0, DMC0_DQxx, DMC0_LDQS, DMC0_LDQS, DMC0_UDQS, DMC0_UDQS, DMC0_LDM, DMC0_UDM, DMC0_ODT, DMC0_RAS, and DMC0_WE signals.

[12] Applies to PA_xx, PB_xx, PC_xx, SMC0_A0E, SMC0_Axx, SMC0_Dxx, SYS_FAULT, JTG_TDO_SWO, USB0_DM, USB0_DP, USB0_ID, USB0_VBC, USB0_VBUS, DMC0_Axx, DMC0_BAx, DMC0_CAS, DMC0_CS0, DMC0_DQxx, DMC0_LDQS, DMC0_LDQS, DMC0_UDQS, DMC0_UDQS, DMC0_LDM, DMC0_UDM, DMC0_ODT, DMC0_RAS, DMC0_WE, and TWI signals.

[13] Applies to USB0_VBUS signals.

[14] Applies to all TWI signals.

[15] Applies to all signals, except DMC0 and TWI signals.

[16] Applies to all DMC0 signals.

[17] See the *ADSP-BF70x Blackfin+ Processor Hardware Reference* for definition of deep sleep and hibernate operating modes.

[18] Additional information can be found at Total Internal Power Dissipation.

[19] Applies to VDD_EXT, VDD_DMC, and VDD_USB supply signals only. Clock inputs are tied high or low.

Table 21. Static Current—$I_{DD\_DEEPSLEEP}$ (mA)

	Voltage (V_{DD_INT})

Asynchronous Page Mode Read

Table 34 and Figure 13 show asynchronous memory page mode read timing, related to the static memory controller (SMC).

Table 34. Asynchronous Page Mode Read

Parameter		V_{DD_EXT} 1.8 V /3.3 V Nominal Min	Max	Unit
Switching Characteristics				
t_{AV}	SMC0_Ax (Address) Valid for First Address Min Width[1]	(PREST + RST + PREAT + RAT) × t_{SCLK0} – 2		ns
t_{AV1}	SMC0_Ax (Address) Valid for Subsequent SMC0_Ax (Address) Min Width	PGWS × t_{SCLK0} – 2		ns
t_{WADV}	SMC0_NORDV Active Low Width[2]	RST × t_{SCLK0} – 2		ns
t_{HARE}	Output[3] Hold After $\overline{\text{SMC0\_ARE}}$ High[4]	RHT × t_{SCLK0} – 2		ns
t_{WARE}[5]	$\overline{\text{SMC0\_ARE}}$ Active Low Width[6]	(RAT + (Nw – 1) × PGWS) × t_{SCLK0} – 2		ns

[1] PREST, RST, PREAT and RAT values set using the SMC_BxETIM.PREST bits, SMC_BxTIM.RST bits, SMC_BxETIM.PREAT bits, and the SMC_BxTIM.RAT bits.
[2] RST value set using the SMC_BxTIM.RST bits.
[3] Output signals are SMC0_Ax, $\overline{\text{SMC0\_AMSx}}$, $\overline{\text{SMC0\_AOE}}$.
[4] RHT value set using the SMC_BxTIM.RHT bits.
[5] SMC_BxCTL.ARDYEN bit = 0.
[6] RAT value set using the SMC_BxTIM.RAT bits.

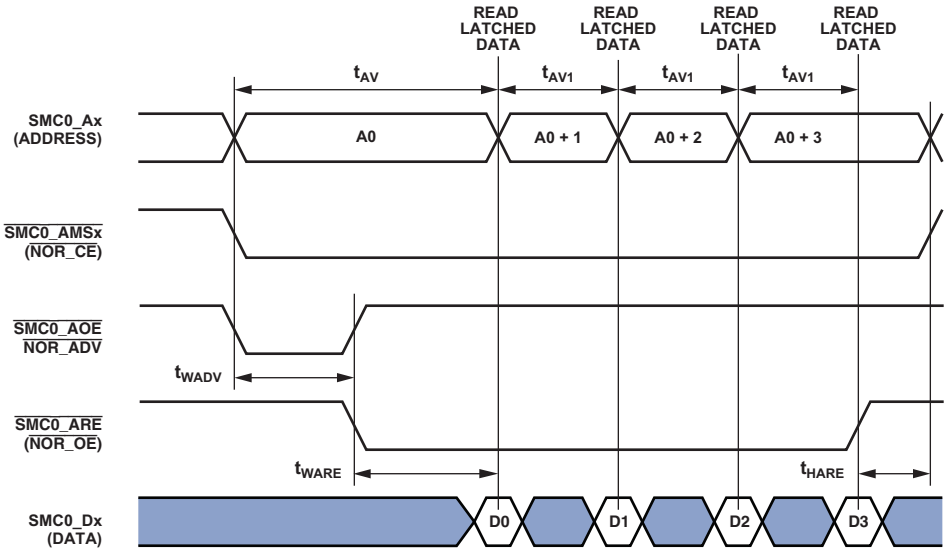

Figure 13. Asynchronous Page Mode Read

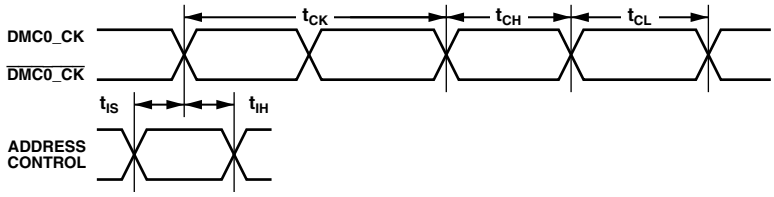
DDR2 SDRAM Clock and Control Cycle Timing

Table 39 and Figure 17 show DDR2 SDRAM clock and control cycle timing, related to the dynamic memory controller (DMC).

Table 39. DDR2 SDRAM Read Cycle Timing, V_{DD_DMC} Nominal 1.8 V

Parameter		200 MHz Min	200 MHz Max	Unit
Switching Characteristics				
t_{CK}	Clock Cycle Time (CL = 2 Not Supported)	5		ns
t_{CH}	High Clock Pulse Width	0.45	0.55	t_{CK}
t_{CL}	Low Clock Pulse Width	0.45	0.55	t_{CK}
t_{IS}	Control/Address Setup Relative to DMC0_CK Rise	350		ps
t_{IH}	Control/Address Hold Relative to DMC0_CK Rise	475		ps



NOTE: CONTROL = $\overline{\text{DMC0\_CS0}}$, DMC0_CKE, $\overline{\text{DMC0\_RAS}}$, $\overline{\text{DMC0\_CAS}}$, AND $\overline{\text{DMC0\_WE}}$.
ADDRESS = DMC0_A00–13, AND DMC0_BA0–2.

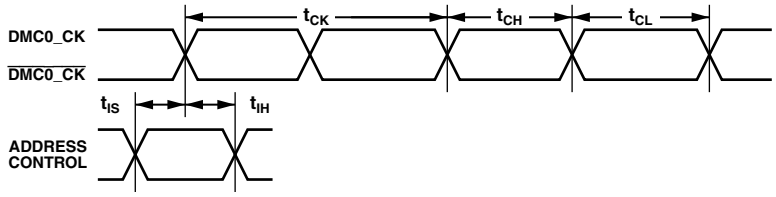
Figure 17. DDR2 SDRAM Clock and Control Cycle Timing

Mobile DDR SDRAM Clock and Control Cycle Timing

Table 42 and Figure 20 show mobile DDR SDRAM clock and control cycle timing, related to the dynamic memory controller (DMC).

Table 42. Mobile DDR SDRAM Clock and Control Cycle Timing, V_{DD_DMC} Nominal 1.8 V

Parameter		200 MHz Min	200 MHz Max	Unit
Switching Characteristics				
t_{CK}	Clock Cycle Time (CL = 2 Not Supported)	5		ns
t_{CH}	Minimum Clock Pulse Width	0.45	0.55	t_{CK}
t_{CL}	Maximum Clock Pulse Width	0.45	0.55	t_{CK}
t_{IS}	Control/Address Setup Relative to DMC0_CK Rise	1.5		ns
t_{IH}	Control/Address Hold Relative to DMC0_CK Rise	1.5		ns



NOTE: CONTROL = $\overline{\text{DMC0\_CS0}}$, DMC0_CKE, $\overline{\text{DMC0\_RAS}}$, $\overline{\text{DMC0\_CAS}}$, AND $\overline{\text{DMC0\_WE}}$.
ADDRESS = DMC0_A00–13, AND DMC0_BA0–2.

Figure 20. Mobile DDR SDRAM Clock and Control Cycle Timing

Up/Down Counter/Rotary Encoder Timing

Table 47 and Figure 25 describe timing, related to the general-purpose counter (CNT).

Table 47. Up/Down Counter/Rotary Encoder Timing

Parameter		V_{DD_EXT} 1.8 V Nominal Min	V_{DD_EXT} 1.8 V Nominal Max	V_{DD_EXT} 3.3 V Nominal Min	V_{DD_EXT} 3.3 V Nominal Max	Unit
Timing Requirement						
t_{WCOUNT}	Up/Down Counter/Rotary Encoder Input Pulse Width	$2 \times t_{SCLK0}$		$2 \times t_{SCLK0}$		ns

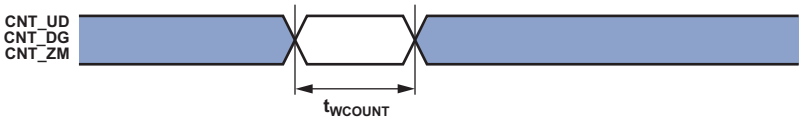


Figure 25. Up/Down Counter/Rotary Encoder Timing

Serial Ports

To determine whether serial port (SPORT) communication is possible between two devices at clock speed n, the following specifications must be confirmed: 1) frame sync delay and frame sync setup and hold, 2) data delay and data setup and hold, and 3) serial clock (SPT_CLK) width. In Figure 27 either the rising edge or the falling edge of SPT_CLK (external or internal) can be used as the active sampling edge.

When externally generated the SPORT clock is called $f_{SPTCLKEXT}$:

$$t_{SPTCLKEXT} = \frac{1}{f_{SPTCLKEXT}}$$

When internally generated, the programmed SPORT clock ($f_{SPTCLKPROG}$) frequency in MHz is set by the following equation where CLKDIV is a field in the SPORT_DIV register that can be set from 0 to 65,535:

$$f_{SPTCLKPROG} = \frac{f_{SCLK0}}{(CLKDIV + 1)}$$

$$t_{SPTCLKPROG} = \frac{1}{f_{SPTCLKPROG}}$$

Table 49. Serial Ports—External Clock

Parameter		V_{DD_EXT} 1.8 V Nominal Min	V_{DD_EXT} 1.8 V Nominal Max	V_{DD_EXT} 3.3 V Nominal Min	V_{DD_EXT} 3.3 V Nominal Max	Unit
Timing Requirements						
t_{SFSE}	Frame Sync Setup Before SPT_CLK (Externally Generated Frame Sync in Either Transmit or Receive Mode)[1]	1.5		1		ns
t_{HFSE}	Frame Sync Hold After SPT_CLK (Externally Generated Frame Sync in Either Transmit or Receive Mode)[1]	3		3		ns
t_{SDRE}	Receive Data Setup Before Receive SPT_CLK[1]	1.5		1		ns
t_{HDRE}	Receive Data Hold After SPT_CLK[1]	3		3		ns
t_{SCLKW}	SPT_CLK Width[2]	$(0.5 \times t_{SPTCLKEXT}) - 1$		$(0.5 \times t_{SPTCLKEXT}) - 1$		ns
$t_{SPTCLKE}$	SPT_CLK Period[2]	$t_{SPTCLKEXT} - 1$		$t_{SPTCLKEXT} - 1$		ns
Switching Characteristics						
t_{DFSE}	Frame Sync Delay After SPT_CLK (Internally Generated Frame Sync in Either Transmit or Receive Mode)[3]		18		15	ns
t_{HOFSE}	Frame Sync Hold After SPT_CLK (Internally Generated Frame Sync in Either Transmit or Receive Mode)[3]	2.5		2.5		ns
t_{DDTE}	Transmit Data Delay After Transmit SPT_CLK[3]		18		15	ns
t_{HDTE}	Transmit Data Hold After Transmit SPT_CLK[3]	2.5		2.5		ns

[1] Referenced to sample edge.

[2] This specification indicates the minimum instantaneous width or period that can be tolerated due to duty cycle variation or jitter on the external SPT_CLK. For the external SPT_CLK ideal maximum frequency, see the $f_{SPTCLKEXT}$ specification in Table 18 on Page 52 in Clock Related Operating Conditions.

[3] Referenced to drive edge.

Table 58. SPI Port—ODM Slave Mode

Parameter		V_{DD_EXT} 1.8 V Nominal Min	V_{DD_EXT} 1.8 V Nominal Max	V_{DD_EXT} 3.3 V Nominal Min	V_{DD_EXT} 3.3 V Nominal Max	Unit
Switching Characteristics						
$t_{HDSPIODMS}$	SPI_CLK Edge to High Impedance from Data Out Valid	2.5		2.5		ns
$t_{DDSPIODMS}$	SPI_CLK Edge to Data Out Valid from High Impedance		17.5		14.5	ns

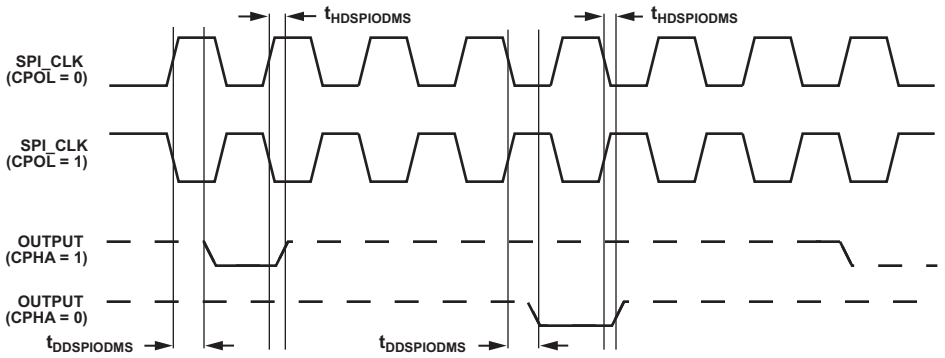

Figure 36. ODM Slave

Dimensions for the 12 mm × 12 mm LFCSP_VQ package in Figure 72 are shown in millimeters.

SURFACE-MOUNT DESIGN

Table 71 is provided as an aid to PCB design. For industry-standard design recommendations, refer to IPC-7351, *Generic Requirements for Surface-Mount Design and Land Pattern Standard*.

Table 71. CSP_BGA Data for Use with Surface-Mount Design

Package	Package Ball Attach Type	Package Solder Mask Opening	Package Ball Pad Size
BC-184-1	Solder Mask Defined	0.4 mm Diameter	0.5 mm Diameter
