

Welcome to E-XFL.COM

#### What is "Embedded - Microcontrollers"?

"Embedded - Microcontrollers" refer to small, integrated circuits designed to perform specific tasks within larger systems. These microcontrollers are essentially compact computers on a single chip, containing a processor core, memory, and programmable input/output peripherals. They are called "embedded" because they are embedded within electronic devices to control various functions, rather than serving as standalone computers. Microcontrollers are crucial in modern electronics, providing the intelligence and control needed for a wide range of applications.

#### Applications of "<u>Embedded -</u> <u>Microcontrollers</u>"

#### Details

20000	
Product Status	Obsolete
Core Processor	Z8
Core Size	8-Bit
Speed	8MHz
Connectivity	-
Peripherals	HLVD, POR, WDT
Number of I/O	32
Program Memory Size	8KB (8K x 8)
Program Memory Type	OTP
EEPROM Size	-
RAM Size	237 x 8
Voltage - Supply (Vcc/Vdd)	2V ~ 3.6V
Data Converters	-
Oscillator Type	Internal
Operating Temperature	-40°C ~ 105°C (TA)
Mounting Type	Through Hole
Package / Case	40-DIP (0.620", 15.75mm)
Supplier Device Package	-
Purchase URL	https://www.e-xfl.com/product-detail/zilog/zgp323lep4008c

Email: info@E-XFL.COM

Address: Room A, 16/F, Full Win Commercial Centre, 573 Nathan Road, Mongkok, Hong Kong

- Port 1: 0–3 pull-up transistors
- Port 1: 4–7 pull-up transistors
- Port 2: 0–7 pull-up transistors
- EPROM Protection
- WDT enabled at POR
- **Note:** The mask option pull-up transistor has a *typical* equivalent resistance of 200 K $\Omega$  ±50% at V<sub>CC</sub>=3 V and 450 K $\Omega$  ±50% at  $V_{CC}=2$  V.

## **General Description**

The Z8 GP<sup>TM</sup> OTP MCU Family is an OTP-based member of the MCU family of infrared microcontrollers. With 237B of general-purpose RAM and up to 32KB of OTP, ZiLOG<sup>®</sup>'s CMOS microcontrollers offer fast-executing, efficient use of memory, sophisticated interrupts, input/output bit manipulation capabilities, automated pulse generation/reception, and internal key-scan pull-up transistors.

The Z8 GP<sup>TM</sup> OTP MCU Family architecture (Figure 1) is based on ZiLOG's 8-bit microcontroller core with an Expanded Register File allowing access to registermapped peripherals, input/output (I/O) circuits, and powerful counter/timer circuitry. The Z8<sup>®</sup> offers a flexible I/O scheme, an efficient register and address space structure, and a number of ancillary features that are useful in many consumer, automotive, computer peripheral, and battery-operated hand-held applications.

There are three basic address spaces available to support a wide range of configurations: Program Memory, Register File and Expanded Register File. The register file is composed of 256 Bytes (B) of RAM. It includes 4 I/O port registers, 16 control and status registers, and 236 general-purpose registers. The Expanded Register File consists of two additional register groups (F and D).

To unburden the program from coping with such real-time problems as generating complex waveforms or receiving and demodulating complex waveform/pulses, the Z8 GP OTP MCU offers a new intelligent counter/timer architecture with 8-bit and 16-bit counter/timers (see Figure 2). Also included are a large number of userselectable modes and two on-board comparators to process analog signals with separate reference voltages.

Note: All signals with an overline, "", are active Low. For example,  $B/\overline{W}$ , in which WORD is active Low, and  $\overline{B}/W$ , in which BYTE is active Low.

Power connections use the conventional descriptions listed in Table 2.

#### Table 8. DC Characteristics (Continued)

#### Notes:

1. All outputs unloaded, inputs at rail.

2. CL1 = CL2 = 100 pF.

3. Oscillator stopped.

4. Oscillator stops when  $V_{CC}$  falls below  $V_{BO}$  limit. 5. It is strongly recommended to add a filter capacitor (minimum 0.1  $\mu$ F), physically close to the  $V_{DD}$  and  $V_{SS}$  pins if operating voltage fluctuations are anticipated, such as those resulting from driving an Infrared LED.

## **Pin Functions**

## XTAL1 Crystal 1 (Time-Based Input)

This pin connects a parallel-resonant crystal or ceramic resonator to the on-chip oscillator input. Additionally, an optional external single-phase clock can be coded to the on-chip oscillator input.

## XTAL2 Crystal 2 (Time-Based Output)

This pin connects a parallel-resonant crystal or ceramic resonant to the on-chip oscillator output.

#### Port 0 (P07-P00)

Port 0 is an 8-bit, bidirectional, CMOS-compatible port. These eight I/O lines are configured under software control as a nibble I/O port. The output drivers are push-pull or open-drain controlled by bit D2 in the PCON register.

If one or both nibbles are needed for I/O operation, they must be configured by writing to the Port 0 mode register. After a hardware reset, Port 0 is configured as an input port.

An optional pull-up transistor is available as a mask option on all Port 0 bits with nibble select.

**Notes:** Internal pull-ups are disabled on any given pin or group of port pins when programmed into output mode.

The Port 0 direction is reset to be input following an SMR.

#### **Comparator Inputs**

In analog mode, P31 and P32 have a comparator front end. The comparator reference is supplied to P33 and Pref1. In this mode, the P33 internal data latch and its corresponding IRQ1 are diverted to the SMR sources (excluding P31, P32, and P33) as indicated in Figure 12 on page 20. In digital mode, P33 is used as D3 of the Port 3 input register, which then generates IRQ1.

**Note:** Comparators are powered down by entering Stop Mode. For P31–P33 to be used in a Stop Mode Recovery source, these inputs must be placed into digital mode.

#### **Comparator Outputs**

These channels can be programmed to be output on P34 and P37 through the PCON register.

## **RESET (Input, Active Low)**

Reset initializes the MCU and is accomplished either through Power-On, Watch-Dog Timer, Stop Mode Recovery, Low-Voltage detection, or external reset. During Power-On Reset and Watch-Dog Timer Reset, the internally generated reset drives the reset pin Low for the POR time. Any devices driving the external reset line must be open-drain to avoid damage from a possible conflict during reset conditions. Pull-up is provided internally.

When the Z8  $GP^{TM}$  asserts (Low) the RESET pin, the internal pull-up is disabled. The Z8  $GP^{TM}$  does not assert the RESET pin when under VBO.

**Note:** The external Reset does not initiate an exit from STOP mode.

## **Functional Description**

This device incorporates special functions to enhance the Z8<sup>®</sup>, functionality in consumer and battery-operated applications.

#### **Program Memory**

This device addresses up to 32KB of OTP memory. The first 12 Bytes are reserved for interrupt vectors. These locations contain the six 16-bit vectors that correspond to the six available interrupts.

#### RAM

This device features 256B of RAM. See Figure 14.

#### Table 13. CTR1(0D)01H T8 and T16 Common Functions (Continued)

#### Note:

\*Default at Power-On Reset.

\*\*Default at Power-On Reset.Not reset with Stop Mode recovery.

#### Mode

If the result is 0, the counter/timers are in TRANSMIT mode; otherwise, they are in DEMODULATION mode.

#### P36\_Out/Demodulator\_Input

In TRANSMIT Mode, this bit defines whether P36 is used as a normal output pin or the combined output of T8 and T16.

In DEMODULATION Mode, this bit defines whether the input signal to the Counter/Timers is from P20 or P31.

If the input signal is from Port 31, a capture event may also generate an IRQ2 interrupt. To prevent generating an IRQ2, either disable the IRQ2 interrupt by clearing its IMR bit D2 or use P20 as the input.

#### T8/T16\_Logic/Edge \_Detect

In TRANSMIT Mode, this field defines how the outputs of T8 and T16 are combined (AND, OR, NOR, NAND).

In DEMODULATION Mode, this field defines which edge should be detected by the edge detector.

#### Transmit\_Submode/Glitch Filter

In Transmit Mode, this field defines whether T8 and T16 are in the PING-PONG mode or in independent normal operation mode. Setting this field to "NORMAL OPERATION Mode" terminates the "PING-PONG Mode" operation. When set to 10, T16 is immediately forced to a 0; a setting of 11 forces T16 to output a 1.

In DEMODULATION Mode, this field defines the width of the glitch that must be filtered out.

#### Initial\_T8\_Out/Rising\_Edge

In TRANSMIT Mode, if 0, the output of T8 is set to 0 when it starts to count. If 1, the output of T8 is set to 1 when it starts to count. When the counter is not enabled and this bit is set to 1 or 0, T8\_OUT is set to the opposite state of this bit. This ensures that when the clock is enabled, a transition occurs to the initial state set by CTR1, D1.

In DEMODULATION Mode, this bit is set to 1 when a rising edge is detected in the input signal. In order to reset the mode, a 1 should be written to this location.

#### Initial\_T16 Out/Falling \_Edge

In TRANSMIT Mode, if it is 0, the output of T16 is set to 0 when it starts to count. If it is 1, the output of T16 is set to 1 when it starts to count. This bit is effective only in Normal or PING-PONG Mode (CTR1, D3; D2). When the counter is not enabled and this bit is set, T16\_OUT is set to the opposite state of this bit. This ensures that when the clock is enabled, a transition occurs to the initial state set by CTR1, D0.

In DEMODULATION Mode, this bit is set to 1 when a falling edge is detected in the input signal. In order to reset it, a 1 should be written to this location.

**Note:** Modifying CTR1 (D1 or D0) while the counters are enabled causes unpredictable output from T8/16\_OUT.

#### CTR2 Counter/Timer 16 Control Register—CTR2(D)02H

Table 14 lists and briefly describes the fields for this register.

#### Table 15. CTR3 (D)03H: T8/T16 Control Register (Continued)

Field	Bit Position		Value	Description
Reserved	43210	R	1	Always reads 11111
		W	х	No Effect

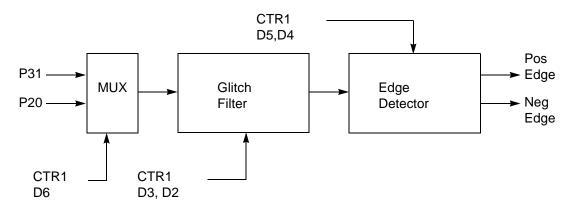

Note: \*Indicates the value upon Power-On Reset.

\*\*Indicates the value upon Power-On Reset. Not reset with Stop Mode recovery.

## **Counter/Timer Functional Blocks**

#### Input Circuit

The edge detector monitors the input signal on P31 or P20. Based on CTR1 D5– D4, a pulse is generated at the Pos Edge or Neg Edge line when an edge is detected. Glitches in the input signal that have a width less than specified (CTR1 D3, D2) are filtered out (see Figure 18).

#### Figure 18. Glitch Filter Circuitry

#### **T8 Transmit Mode**

Before T8 is enabled, the output of T8 depends on CTR1, D1. If it is 0, T8\_OUT is 1; if it is 1, T8\_OUT is 0. See Figure 19.

When T8 is enabled, the output T8\_OUT switches to the initial value (CTR1, D1). If the initial value (CTR1, D1) is 0, TC8L is loaded; otherwise, TC8H is loaded into the counter. In SINGLE-PASS Mode (CTR0, D6), T8 counts down to 0 and stops, T8\_OUT toggles, the timeout status bit (CTR0, D5) is set, and a timeout interrupt can be generated if it is enabled (CTR0, D1). In Modulo-N Mode, upon reaching terminal count, T8\_OUT is toggled, but no interrupt is generated. From that point, T8 loads a new count (if the T8\_OUT level now is 0), TC8L is loaded; if it is 1, TC8H is loaded. T8 counts down to 0, toggles T8\_OUT, and sets the timeout status bit (CTR0, D5), thereby generating an interrupt if enabled (CTR0, D1). One cycle is thus completed. T8 then loads from TC8H or TC8L according to the T8\_OUT level and repeats the cycle. See Figure 20.

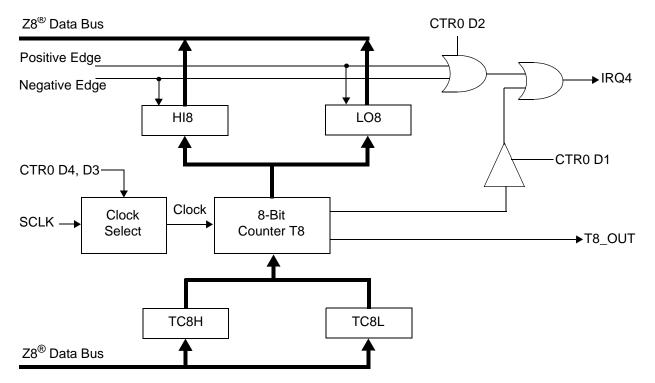

Figure 20. 8-Bit Counter/Timer Circuits

You can modify the values in TC8H or TC8L at any time. The new values take effect when they are loaded.

Ca

**Caution:** To ensure known operation do not write these registers at the time the values are to be loaded into the counter/timer. *An initial count of 1 is not allowed (a non-function occurs).* An initial count of 0 causes TC8 to count from 0 to FFH to FEH.

Figure 28. Ping-Pong Mode Diagram

#### Initiating PING-PONG Mode

First, make sure both counter/timers are not running. Set T8 into Single-Pass mode (CTR0, D6), set T16 into SINGLE-PASS mode (CTR2, D6), and set the Ping-Pong mode (CTR1, D2; D3). These instructions can be in random order. Finally, start PING-PONG mode by enabling either T8 (CTR0, D7) or T16 (CTR2, D7). See Figure 29.

The initial value of T8 or T16 must not be 1. Stopping the timer and restarting the timer reloads the initial value to avoid an unknown previous value.

Name	Source	Vector Location	Comments
IRQ0	P32	0,1	External (P32), Rising, Falling Edge Triggered
IRQ1	P33	2,3	External (P33), Falling Edge Triggered
IRQ2	P31, T <sub>IN</sub>	4,5	External (P31), Rising, Falling Edge Triggered
IRQ3	T16	6,7	Internal
IRQ4	Т8	8,9	Internal
IRQ5	LVD	10,11	Internal

#### Table 16. Interrupt Types, Sources, and Vectors

When more than one interrupt is pending, priorities are resolved by a programmable priority encoder controlled by the Interrupt Priority Register. An interrupt machine cycle activates when an interrupt request is granted. As a result, all subsequent interrupts are disabled, and the Program Counter and Status Flags are saved. The cycle then branches to the program memory vector location reserved for that interrupt. All Z8 GP<sup>TM</sup> OTP MCU Family interrupts are vectored through locations in the program memory. This memory location and the next byte contain the 16-bit address of the interrupt service routine for that particular interrupt request. To accommodate polled interrupt systems, interrupt inputs are masked, and the Interrupt Request register is polled to determine which of the interrupt requests require service.

An interrupt resulting from AN1 is mapped into IRQ2, and an interrupt from AN2 is mapped into IRQ0. Interrupts IRQ2 and IRQ0 can be rising, falling, or both edge triggered. These interrupts are programmable by the user. The software can poll to identify the state of the pin.

Programming bits for the Interrupt Edge Select are located in the IRQ Register (R250), bits D7 and D6. The configuration is indicated in Table 17.

IRQ		Interrupt Edge				
D7 D6		IRQ2 (P31)	IRQ0 (P32)			
0	0	F	F			
0	1	F	R			
1	0	R	F			
1	1	R/F R/F				
Note: F = Falling Edge; R = Rising Edge						

#### Table 17. IRQ Register

#### Stop-Mode Recovery Source (D2, D3, and D4)

These three bits of the SMR specify the wake-up source of the Stop recovery (Figure 35 and Table 19).

#### Stop-Mode Recovery Register 2—SMR2(F)0DH

Table 18 lists and briefly describes the fields for this register.

Field	Bit Position		Value	Description
Reserved	7		0	Reserved (Must be 0)
Recovery Level	-6	W	0 <sup>†</sup>	Low
-			1	High
Reserved	5		0	Reserved (Must be 0)
Source	432	W	000 <sup>†</sup>	A. POR Only
			001	B. NAND of P23–P20
			010	C. NAND of P27–P20

			100	E. NAND of P33–P31
			101	F. NOR of P33–P31, P00, P07
			110	G. NAND of P33–P31, P00, P07
			111	H. NAND of P33–P31, P22–P20
Reserved	10		00	Reserved (Must be 0)

#### Table 18. SMR2(F)0DH:Stop Mode Recovery Register 2\*

#### Notes:

\* Port pins configured as outputs are ignored as a SMR recovery source. † Indicates the value upon Power-On Reset

#### Low-Voltage Detection Register—LVD(D)0Ch

**Note:** Voltage detection does not work at Stop mode. It must be disabled during Stop mode in order to reduce current.

Field	Bit Position			Description
LVD	76543			Reserved No Effect
	2	R	1 0*	HVD flag set HVD flag reset
	1-	R	1 0*	LVD flag set LVD flag reset
	0	R/W	1 0*	Enable VD Disable VD
*Default	after POR			

**Note:** Do not modify register P01M while checking a low-voltage condition. Switching noise of both ports 0 and 1 together might trigger the LVD flag.

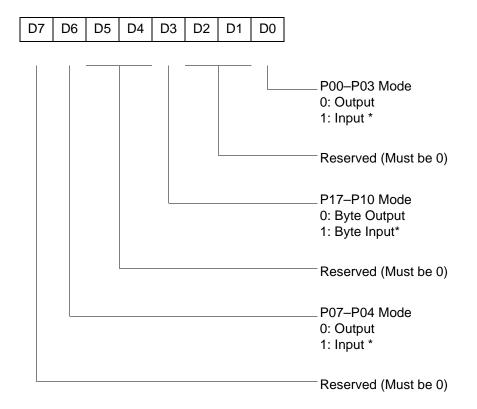

#### **Voltage Detection and Flags**

The Voltage Detection register (LVD, register 0CH at the expanded register bank 0Dh) offers an option of monitoring the V<sub>CC</sub> voltage. The Voltage Detection is enabled when bit 0 of LVD register is set. Once Voltage Detection is enabled, the the V<sub>CC</sub> level is monitored in real time. The flags in the LVD register valid 20uS after Voltage Detection is enabled. The HVD flag (bit 2 of the LVD register) is set only if V<sub>CC</sub> is higher than V<sub>HVD</sub>. The LVD flag (bit 1 of the LVD register) is set only if V<sub>CC</sub> is lower than the V<sub>LVD</sub>. When Voltage Detection is enabled, the LVD flag also triggers IRQ5. The IRQ bit 5 latches the low voltage condition until it is cleared by instructions or reset. The IRQ5 interrupt is served if it is enabled in the IMR register. Otherwise, bit 5 of IRQ register is latched as a flag only.

**Notes:** If it is necessary to receive an LVD interrupt upon power-up at an operating voltage lower than the low battery detect threshold, enable interrupts using the Enable Interrupt instruction (EI) prior to enabling the voltage detection.

#### R248 P01M(F8H)

\* Default setting after reset; only P00, P01 and P07 are available in 20-pin configurations.
