
Welcome to E-XFL.COM

What is "Embedded - Microcontrollers"?

"Embedded - Microcontrollers" refer to small, integrated circuits designed to perform specific tasks within larger systems. These microcontrollers are essentially compact computers on a single chip, containing a processor core, memory, and programmable input/output peripherals. They are called "embedded" because they are embedded within electronic devices to control various functions, rather than serving as standalone computers. Microcontrollers are crucial in modern electronics, providing the intelligence and control needed for a wide range of applications.

Applications of "Embedded - Microcontrollers"

Details	
Product Status	Active
Core Processor	PIC
Core Size	8-Bit
Speed	20MHz
Connectivity	-
Peripherals	Brown-out Detect/Reset, POR, PWM, WDT
Number of I/O	17
Program Memory Size	3.5KB (2K x 14)
Program Memory Type	FLASH
EEPROM Size	256 x 8
RAM Size	128 x 8
Voltage - Supply (Vcc/Vdd)	2V ~ 5.5V
Data Converters	A/D 14x10b
Oscillator Type	Internal
Operating Temperature	-40°C ~ 85°C (TA)
Mounting Type	Surface Mount
Package / Case	20-VFQFN Exposed Pad
Supplier Device Package	20-QFN (4x4)
Purchase URL	https://www.e-xfl.com/product-detail/microchip-technology/pic16hv785t-i-ml

2.2.2.2 OPTION_REG Register

The Option register is a readable and writable register, which contains various control bits to configure the TMR0/WDT prescaler, the external RA2/INT interrupt, the TMR0 and the weak pull-ups on PORTA.

Note:	To achieve a 1:1 prescaler assignment for TMR0, assign the prescaler to the WDT by setting PSA bit to '1' in the OPTION Register. See **Section 5.4 "Prescaler"**.

REGISTER 2-2: OPTION_REG: OPTION REGISTER

R/W-1	R/W-1	R/W-1	R/W-1	R/W-1	R/W-1	R/W-1	R/W-1
$\overline{\text{RAPU}}$	INTEDG	T0CS	T0SE	PSA	PS2	PS1	PS0
bit 7							bit 0

Legend:			
R = Readable bit	W = Writable bit	U = Unimplemented bit, read as '0'	
-n = Value at POR	'1' = Bit is set	'0' = Bit is cleared	x = Bit is unknown

bit 7 **$\overline{\text{RAPU}}$:** PORTA Pull-up Enable bit
1 = PORTA pull-ups are disabled
0 = PORTA pull-ups are enabled by individual port latch values in WPUA register

bit 6 **INTEDG:** Interrupt Edge Select bit
1 = Interrupt on rising edge of RA2/AN2/T0CKI/INT/C1OUT pin
0 = Interrupt on falling edge of RA2/AN2/T0CKI/INT/C1OUT pin

bit 5 **T0CS:** TMR0 Clock Source Select bit
1 = Transition on RA2/AN2/T0CKI/INT/C1OUT pin
0 = Internal instruction cycle clock (CLKOUT)

bit 4 **T0SE:** TMR0 Source Edge Select bit
1 = Increment on high-to-low transition on RA2/AN2/T0CKI/INT/C1OUT pin
0 = Increment on low-to-high transition on RA2/AN2/T0CKI/INT/C1OUT pin

bit 3 **PSA:** Prescaler Assignment bit
1 = Prescaler is assigned to the WDT
0 = Prescaler is assigned to the Timer0 module

bit 2-0 **PS<2:0>:** Prescaler Rate Select bits

Bit Value	TMR0 Rate	WDT Rate(1)
000	1 : 2	1 : 1
001	1 : 4	1 : 2
010	1 : 8	1 : 4
011	1 : 16	1 : 8
100	1 : 32	1 : 16
101	1 : 64	1 : 32
110	1 : 128	1 : 64
111	1 : 256	1 : 128

Note 1: A dedicated 16-bit WDT postscaler is available for the PIC16F785/HV785. See **Section 15.5 "Watchdog Timer (WDT)"** for more information.

TABLE 4-1: SUMMARY OF REGISTERS ASSOCIATED WITH PORTA

Name	Bit 7	Bit 6	Bit 5	Bit 4	Bit 3	Bit 2	Bit 1	Bit 0	Value on POR, BOR	Value on all other Resets

Legend: x = unknown, u = unchanged, – = unimplemented locations read as '0'. Shaded cells are not used by PORTA.

4.3 PORTB and TRISB Registers

PORTB is a 4-bit wide, bidirectional port. The corresponding data direction register is TRISB (Register 4-6). Setting a TRISB bit (= 1) will make the corresponding PORTB pin an input (i.e., put the corresponding output driver in a High-Impedance mode). Clearing a TRISB bit (= 0) will make the corresponding PORTB pin an output (i.e., put the contents of the output latch on the selected pin). Example 4-2 shows how to initialize PORTB.

Reading the PORTB register (Register 4-5) reads the status of the pins, whereas writing to it will write to the port latch. All write operations are read-modify-write operations. Therefore, a write to a port implies that the port pins are read, this value is modified and then written to the port data latch.

Pin RB6 is an open drain output. All other PORTB pins have full CMOS output drivers.

The TRISB register controls the direction of the PORTB pins, even when they are being used as analog inputs. The user must ensure the bits in the TRISB register are maintained set when using them as analog inputs. I/O pins configured as analog input always read '0'.

Note:	The ANSEL1 (93h) register must be initialized to configure an analog channel as a digital input. Pins configured as analog inputs will read '0'.

EXAMPLE 4-2: INITIALIZING PORTB

```
BCF    STATUS,RP0    ;Bank 0
BCF    STATUS,RP1    ;
CLRF   PORTB         ;Init PORTB
BSF    STATUS,RP0    ;Bank 1
BCF    ANSEL1,2      ;digital I/O - RB4
BCF    ANSEL1,3      ;digital I/O - RB5
MOVLW  30h           ;Set RB<5:4> as inputs
MOVWF  TRISB         ;and set RB<7:6>
                     ;as outputs
BCF    STATUS,RP0    ;Bank 0
```

REGISTER 4-5: PORTB: PORTB REGISTER

R/W-x	R/W-x	R/W-x(1)	R/W-x(1)	U-0	U-0	U-0	U-0
RB7	RB6	RB5	RB4	—	—	—	—
bit 7							bit 0

Legend:			
R = Readable bit	W = Writable bit	U = Unimplemented bit, read as '0'	
-n = Value at POR	'1' = Bit is set	'0' = Bit is cleared	x = Bit is unknown

bit 7-4 **RB<7:4>:** PORTB General Purpose I/O Pin bits
1 = Port pin is greater than VIH
0 = Port pin is less than VIL

bit 3-0 **Unimplemented**: Read as '0'

Note 1: Data latches are unknown after a POR, but each port bit reads '0' when the corresponding analog select bit is '1' (see Register 12-2 on page 82).

REGISTER 4-6: TRISB: PORTB TRI-STATE REGISTER

R/W-1	R/W-1	R/W-1	R/W-1	U-0	U-0	U-0	U-0
TRISB7	TRISB6	TRISB5	TRISB4	—	—	—	—
bit 7							bit 0

Legend:			
R = Readable bit	W = Writable bit	U = Unimplemented bit, read as '0'	
-n = Value at POR	'1' = Bit is set	'0' = Bit is cleared	x = Bit is unknown

bit 7-4 **TRISB<7:4>:** PORTB Tri-State Control bits
1 = PORTB pin configured as an input (tri-stated)
0 = PORTB pin configured as an output

bit 3-0 **Unimplemented**: Read as '0'

5.3 Using Timer0 with an External Clock

When no prescaler is used, the external clock input is the same as the prescaler output. The synchronization of T0CKI, with the internal phase clocks, is accomplished by sampling the prescaler output on the Q2 and Q4 cycles of the internal phase clocks. Therefore, it is necessary for T0CKI to be high for at least 2TOSC (and a small RC delay of 20 ns) and low for at least 2TOSC (and a small RC delay of 20 ns). Refer to the electrical specification of the desired device.

5.4 Prescaler

An 8-bit counter is available as a prescaler for the Timer0 module, or as a postscaler for the Watchdog Timer. For simplicity, this counter will be referred to as "prescaler" throughout this Data Sheet. The prescaler assignment is controlled in software by the control bit PSA of the OPTION Register. Clearing the PSA bit will assign the prescaler to Timer0. Prescale values are selectable via the PS<2:0> bits of the OPTION Register.

The prescaler is not readable or writable. When assigned to the Timer0 module, all instructions writing to the TMR0 register (e.g., `CLRF 1, MOVWF 1, BSF 1,x....etc.`) will clear the prescaler. When assigned to WDT, a `CLRWDT` instruction will clear the prescaler along with the Watchdog Timer.

5.4.1 SWITCHING PRESCALER ASSIGNMENT

The prescaler assignment is fully under software control (i.e., it can be changed "on the fly" during program execution). To avoid an unintended device Reset, the following instruction sequence (Example 5-1 and Example 5-2) must be executed when changing the prescaler assignment between Timer0 and WDT.

EXAMPLE 5-1: CHANGING PRESCALER (TIMER0→WDT)

```
BCF     STATUS,RP0      ;Bank 0
BCF     STATUS,RP1      ;
CLRWDT                  ;Clear WDT
CLRF    TMR0            ;Clear TMR0 and
                        ; prescaler
BSF     STATUS,RP0      ;Bank 1

MOVLW   b'00101111'     ;Required if desired
MOVWF   OPTION_REG      ; PS2:PS0 is
CLRWDT                  ; 000 or 001
                        ;
MOVLW   b'00101xxx'     ;Set postscaler to
MOVWF   OPTION_REG      ; desired WDT rate
BCF     STATUS,RP0      ;Bank 0
```

To change prescaler from the WDT to the TMR0 module, use the sequence shown in Example 5-2. This precaution must be taken even if the WDT is disabled.

EXAMPLE 5-2: CHANGING PRESCALER (WDT→TIMER0)

```
CLRWDT                  ;Clear WDT and
                        ; prescaler
BSF     STATUS,RP0      ;Bank 1
BCF     STATUS,RP1      ;

MOVLW   b'xxxx0xxx'     ;Select TMR0,
                        ; prescale, and
                        ; clock source
MOVWF   OPTION_REG      ;
BCF     STATUS,RP0      ;Bank 0
```

TABLE 5-1: REGISTERS ASSOCIATED WITH TIMER0

Name	Bit 7	Bit 6	Bit 5	Bit 4	Bit 3	Bit 2	Bit 1	Bit 0	Value on POR, BOR	Value on all other Resets

REGISTER 9-1: CM1CON0: COMPARATOR C1 CONTROL REGISTER 0

R/W-0	R-0	R/W-0	R/W-0	R/W-0	R/W-0	R/W-0	R/W-0
C1ON	C1OUT	C1OE	C1POL	C1SP	C1R	C1CH1	C1CH0
bit 7							bit 0

Legend:			
R = Readable bit	W = Writable bit	U = Unimplemented bit, read as '0'	
-n = Value at POR	'1' = Bit is set	'0' = Bit is cleared	x = Bit is unknown

bit 7 **C1ON:** Comparator C1 Enable bit
1 = C1 Comparator is enabled
0 = C1 Comparator is disabled

bit 6 **C1OUT:** Comparator C1 Output bit
If C1POL = 1 (inverted polarity):
C1OUT = 1, C1VP < C1VN
C1OUT = 0, C1VP > C1VN
If C1POL = 0 (non-inverted polarity):
C1OUT = 1, C1VP > C1VN
C1OUT = 0, C1VP < C1VN

bit 5 **C1OE:** Comparator C1 Output Enable bit
1 = C1OUT is present on the RA2/AN2/T0CKI/INT/C1OUT pin**(1)**
0 = C1OUT is internal only

bit 4 **C1POL:** Comparator C1 Output Polarity Select bit
1 = C1OUT logic is inverted
0 = C1OUT logic is not inverted

bit 3 **C1SP:** Comparator C1 Speed Select bit
1 = C1 operates in normal speed mode
0 = C1 operates in low-power, slow speed mode

bit 2 **C1R:** Comparator C1 Reference Select bit (non-inverting input)
1 = C1VP connects to C1V_{REF} output
0 = C1VP connects to RA0/AN0/C1IN+/ICSPDAT

bit 1-0 **C1CH<1:0>:** Comparator C1 Channel Select bits
00 = C1VN of C1 connects to RA1/AN1/C12IN0-/V_{REF}/ICSPCLK
01 = C1VN of C1 connects to RC1/AN5/C12IN1-/PH1
10 = C1VN of C1 connects to RC2/AN6/C12IN2-/OP2
11 = C1VN of C1 connects to RC3/AN7/C12IN3-/OP1

Note 1: C1OUT will only drive RA2/AN2/T0CKI/INT/C1OUT if: (C1OE = 1) and (C1ON = 1) and (TRISA<2> = 0).

9.2 Comparator Outputs

The comparator outputs are read through the CM1CON0, COM2CON0 or CM2CON1 registers. CM1CON0 and CM2CON0 each contain the individual comparator output of Comparator 1 and Comparator 2, respectively. CM2CON2 contains a mirror copy of both comparator outputs facilitating a simultaneous read of both comparators. These bits are read-only. The comparator outputs may also be directly output to the RA2/AN2/T0CKI/INT/C1OUT and RC4/C2OUT/PH2 I/O pins. When enabled, multiplexers in the output path of the RA2 and RC4 pins will switch and the output of each pin will be the unsynchronized output of the comparator. The uncertainty of each of the comparators is related to the input offset voltage and the response time given in the specifications. Figure 9-1 and Figure 9-2 show the output block diagrams for Comparators 1 and 2, respectively.

The TRIS bits will still function as an output enable/ disable for the RA2/AN2/T0CKI/INT/C1OUT and RC4/ C2OUT/PH2 pins while in this mode.

The polarity of the comparator outputs can be changed using the C1POL and C2POL bits of the CMxCON0 Register.

Timer1 gate source can be configured to use the T1G pin or Comparator 2 output as selected by the T1GSS bit of the CM2CON1 Register. The Timer1 gate feature can be used to time the duration or interval of analog events. The output of Comparator 2 can also be synchronized with Timer1 by setting the C2SYNC bit of the CM2CON1 Register. When enabled, the output of Comparator 2 is latched on the falling edge of the Timer1 clock source. If a prescaler is used with Timer1, Comparator 2 is latched after the prescaler. To prevent a race condition, the Comparator 2 output is latched on the falling edge of the Timer1 clock source and Timer1 increments on the rising edge of its clock source. See the Comparator 2 Block Diagram (Figure 9-2) and the Timer1 Block Diagram (Figure 6-1) for more information.

It is recommended to synchronize Comparator 2 with Timer1 by setting the C2SYNC bit when Comparator 2 is used as the Timer1 gate source. This ensures Timer1 does not miss an increment if Comparator 2 changes during an increment.

9.3 Comparator Interrupts

The comparator interrupt flags are set whenever there is a change in the output value of its respective comparator. Software will need to maintain information about the status of the output bits, as read from CM2CON0<7:6>, to determine the actual change that has occurred. The CxIF bits, PIR1<4:3>, are the Comparator Interrupt Flags. Each comparator interrupt bit must be reset in software by clearing it to '0'. Since it is also possible to write a '1' to this register, a simulated interrupt may be initiated.

The CxIE bits of the PIE1 Register and the PEIE bit of the INTCON Register must be set to enable the interrupts. In addition, the GIE bit must also be set. If any of these bits are cleared, the interrupt is not enabled, though the CxIF bits will still be set if an interrupt condition occurs.

The comparator interrupt of the PIC16F785/HV785 differs from previous designs in that the interrupt flag is set by the mismatch edge and not the mismatch level. This means that the interrupt flag can be reset without the additional step of reading or writing the CMxCON0 register to clear the mismatch registers. When the mismatch registers are not cleared, an interrupt will not occur when the comparator output returns to the previous state. When the mismatch registers are cleared, an interrupt will occur when the comparator returns to the previous state.

Note 1: If a change in the CMxCON0 register (CxOUT) should occur when a read operation is being executed (start of the Q2 cycle), then the CxIF of the PIR1 Register interrupt flag may not get set.

2: When either comparator is first enabled, bias circuitry in the Comparator module may cause an invalid output from the comparator until the bias circuitry is stable. Allow about 1 μs for bias settling then clear the mismatch condition and interrupt flags before enabling comparator interrupts.

9.4 Effects of Reset

A Reset forces all registers to their Reset state. This disables both comparators.

REGISTER 12-3: ADCON0: A/D CONTROL REGISTER

R/W-0	R/W-0	R/W-0	R/W-0	R/W-0	R/W-0	R/W-0	R/W-0

SS =	Sampling Switch
CHOLD =	Sample/Hold Capacitance (from DAC)

12.4 Effects of Reset

A device Reset forces all registers to their Reset state. Thus, the A/D module is turned off and any pending conversion is aborted. The ADRESH:ADRESL registers are unchanged.

12.5 Use of the CCP Trigger

An A/D conversion can be started by the "special event trigger" of the CCP module. This requires that the CCP1M3:CCP1M0 bits of the CCP1CON Register be programmed as '1011' and that the A/D module is enabled (ADON bit is set). When the trigger occurs, the GO/DONE bit will be set, starting the A/D conversion and the Timer1 counter will be reset to zero. Timer1 is reset to automatically repeat the A/D acquisition period with minimal software overhead (moving the ADRESH:ADRESL to the desired location).

The appropriate analog input channel must be selected and the minimum acquisition done before the "special event trigger" sets the GO/DONE bit (starts a conversion).

If the A/D module is not enabled (ADON is cleared), then the "special event trigger" will be ignored by the A/D module, but will still reset the Timer1 counter. See **Section 8.0 "Capture/Compare/PWM (CCP) Module"** for more information.

TABLE 12-3: SUMMARY OF A/D REGISTERS

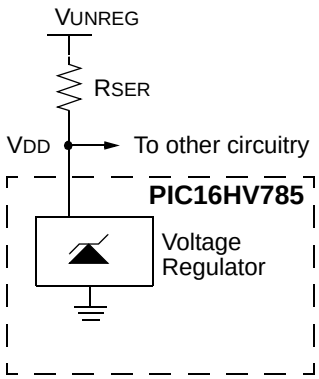
16.0 VOLTAGE REGULATOR

The PIC16HV785 includes a permanent internal 5 volt (nominal) shunt regulator in parallel with the VDD pin. This eliminates the need for an external voltage regulator in systems sourced by an unregulated supply. All external devices connected directly to the VDD pin will share the regulated supply voltage and contribute to the total VDD supply current (ILOAD).

16.1 Regulator Operation

The regulator operates by maintaining a constant voltage at the VDD pin by adjusting the regulator shunt current in response to variations of the VDD supply load and the unregulated supply voltage. The regulator behaves like a fully compensated Zener diode. (See Figure 16-1).

FIGURE 16-1: REGULATOR



An external current limiting resistor, RSER, located between the unregulated supply, VUNREG, and the VDD pin, drops the difference in voltage between VUNREG and VDD. RSER must be between RMAX and RMIN as defined by Equation 16-1.

EQUATION 16-1: RSER LIMITING RESISTOR

$$R_{MAX} = \frac{(VU_{MIN} - V_{DD}) \cdot 1000}{1.05 \cdot (4\ mA + I_{LOAD})}$$

$$R_{MIN} = \frac{(VU_{MIN} - V_{DD}) \cdot 1000}{0.95 \cdot (50\ mA)}$$

Where:

RMAX = maximum value of RSER (ohms)

RMIN = minimum value of RSER (ohms)

VUMIN = minimum value of VUNREG

VUMAX = maximum value of VUNREG

VDD = regulated voltage (5V nominal)

ILOAD = maximum expected load current in mA including I/O pin currents and external circuits connected to VDD.

1.05 = compensation for +5% tolerance of RSER

0.95 = compensation for -5% tolerance of RSER

16.2 Regulator Precautions

The total VDD load current variation must be less than 46 mA so that it falls within the voltage regulator shunt current dynamic range. If the load current rises above the expected maximum, the regulator will be starved for current and go out of regulation causing VDD to drop.

Since the regulator uses the band gap voltage as the regulated voltage reference, the VR voltage reference is permanently enabled in the PIC16HV785 device.

(used on blank pages to make page count even)

RETFIE **Return from Interrupt**

Syntax: [*label*] RETFIE

Operands: None

Operation: TOS → PC,
1 → GIE

Status Affected: None

Encoding:

00	0000	0000	1001

Description: Return from Interrupt. Stack is POPed and Top-of-Stack (TOS) is loaded in the PC. Interrupts are enabled by setting Global Interrupt Enable bit, GIE of the INTCON Register. This is a two-cycle instruction.

RETLW **Return with Literal in W**

Syntax: [*label*] RETLW k

Operands: 0 ≤ k ≤ 255

Operation: k → (W);
TOS → PC

Status Affected: None

Encoding:

11	01xx	kkkk	kkkk

Description: The W register is loaded with the eight-bit literal ‘k’. The program counter is loaded from the top of the stack (the return address). This is a two-cycle instruction.

RETURN **Return from Subroutine**

Syntax: [*label*] RETURN

Operands: None

Operation: TOS → PC

Status Affected: None

Description: Return from subroutine. The stack is POPed and the top of the stack (TOS) is loaded into the program counter. This is a two-cycle instruction.

RLF **Rotate Left f through Carry**

Syntax: [*label*] RLF f,d

Operands: 0 ≤ f ≤ 127
d ∈ [0,1]

Operation: See description below

Status Affected: C

Encoding:

00	1101	dfff	ffff

Description: The contents of register ‘f’ are rotated one bit to the left through the Carry Flag. If ‘d’ is ‘0’, the result is placed in the W register. If ‘d’ is ‘1’, the result is stored back in register ‘f’.

RRF **Rotate Right f through Carry**

Syntax: [*label*] RRF f,d

Operands: 0 ≤ f ≤ 127
d ∈ [0,1]

Operation: See description below

Status Affected: C

Encoding:

00	1100	dfff	ffff

Description: The contents of register ‘f’ are rotated one bit to the right through the Carry Flag. If ‘d’ is ‘0’, the result is placed in the W register. If ‘d’ is ‘1’ the result is placed back in register ‘f’.

SLEEP **Go into Standby mode**

Syntax: [*label*] SLEEP

Operands: None

Operation: 00h → WDT,
0 → WDT prescaler,
1 → $\overline{TO}$,
0 → $\overline{PD}$

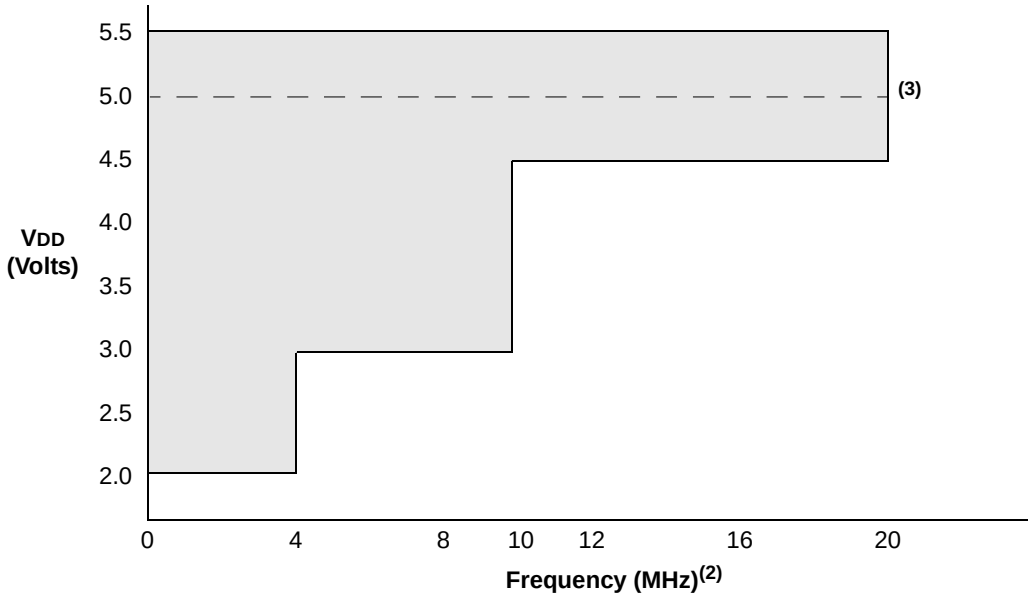
Status Affected: $\overline{TO}$, $\overline{PD}$

Encoding:

00	0000	0110	0011

Description: The power-down Status bit, $\overline{PD}$ is cleared. Time out Status bit, $\overline{TO}$ is set. Watchdog Timer and its prescaler are cleared.
The processor is put into Sleep mode with the oscillator stopped.

FIGURE 19-1: PIC16F785/HV785 WITH ANALOG DISABLED VOLTAGE-FREQUENCY GRAPH, -40°C ≤ TA ≤ +125°C(2)



Note 1: The shaded region indicates the permissible combinations of voltage and frequency.

2: Frequency denotes system clock frequency. When using the HFINTOSC the system clock is after the postscaler.

3: The internal shunt regulator of the PIC16HV785 keeps VDD at or below 5.0V (nominal).

19.2 DC Characteristics: PIC16F785/HV785-I (Industrial)(1), (2)

DC CHARACTERISTICS		Standard Operating Conditions (unless otherwise stated) Operating temperature -40°C ≤ TA ≤ +85°C for industrial					
Param No.	Device Characteristics	Min	Typ†	Max	Units	Conditions	
						VDD	
D010	**Supply Current (IDD)**	—	11	23	µA	2.0	FOSC = 32 kHz LP Oscillator mode
		—	18	38	µA	3.0	
		—	35	75	µA	5.0	
D011		—	140	240	µA	2.0	FOSC = 1 MHz XT Oscillator mode
		—	220	380	µA	3.0	
		—	380	550	µA	5.0	
D012		—	260	360	µA	2.0	FOSC = 4 MHz XT Oscillator mode
		—	420	650	µA	3.0	
		—	0.8	1.1	mA	5.0	
D013		—	130	220	µA	2.0	FOSC = 1 MHz EC Oscillator mode
		—	215	360	µA	3.0	
		—	360	520	µA	5.0	
D014		—	220	340	µA	2.0	FOSC = 4 MHz EC Oscillator mode
		—	375	550	µA	3.0	
		—	0.65	1	mA	5.0	
D015		—	8	20	µA	2.0	FOSC = 31 kHz INTRC mode
		—	16	40	µA	3.0	
		—	31	65	µA	5.0

		—	500	700	µA	3.0	
		—	800	1200	µA	5.0	
D017		—	230	400	µA	2.0	FOSC = 4 MHz EXTRC mode
		—	400	680	µA	3.0	
		—	0.63	1.1	mA	5.0	
D018		—	2.6	3.25	mA	4.5	FOSC = 20 MHz HS Oscillator mode
		—	2.8	3.35	mA	5.0	

† Data in 'Typ' column is at 5.0V, 25°C unless otherwise stated. These parameters are for design guidance only and are not tested.

Note 1: The test conditions for all IDD measurements in Active Operation mode are: OSC1 = external square wave, from rail-to-rail; all I/O pins tri-stated, pulled to VDD; $\overline{MCLR}$ = VDD; WDT disabled.

2: The supply current is mainly a function of the operating voltage and frequency. Other factors such as I/O pin loading and switching rate, oscillator type, internal code execution pattern and temperature also have an impact on the current consumption.

3: The peripheral current is the sum of the base IDD or IPD and the additional current consumed when this peripheral is enabled. The peripheral ∆ current can be determined by subtracting the base IDD or IPD current from this limit. Max values should be used when calculating total current consumption.

4: The power-down current in Sleep mode does not depend on the oscillator type. Power-down current is measured with the part in Sleep mode, with all I/O pins in high-impedance state and tied to VDD. When A/D is off, it will not consume any current other than leakage current. the power-down current spec includes any such leakage from the A/D module.

19.3 DC Characteristics: PIC16F785/HV785-E (Extended)(1), (2)

DC CHARACTERISTICS		Standard Operating Conditions (unless otherwise stated) Operating temperature -40°C ≤ TA ≤ +125°C for extended

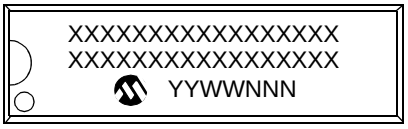
21.0 PACKAGING INFORMATION

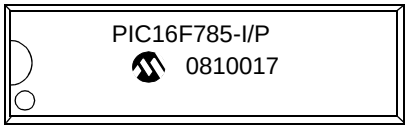
21.1 Package Marking Information

The following sections give the technical details of the packages.

20-Lead PDIP



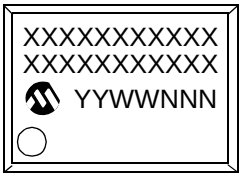
Example



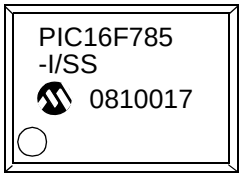
20-Lead SOIC (.300”)

Example

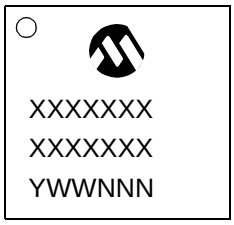
20-Lead SSOP



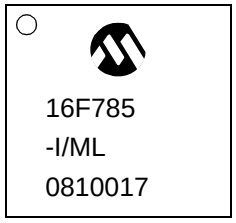
Example



20-Lead QFN



Example



Legend:	XX...X	Customer-specific information
	Y	Year code (last digit of calendar year)
	YY	Year code (last 2 digits of calendar year)
	WW	Week code (week of January 1 is week ‘01’)
	NNN	Alphanumeric traceability code
	(e3)	Pb-free JEDEC designator for Matte Tin (Sn)
	*	This package is Pb-free. The Pb-free JEDEC designator ((e3)) can be found on the outer packaging for this package.

Note: In the event the full Microchip part number cannot be marked on one line, it will be carried over to the next line, thus limiting the number of available characters for customer-specific information.

***** Standard PIC® device marking consists of Microchip part number, year code, week code, and traceability code. For PIC device marking beyond this, certain price adders apply. Please check with your Microchip Sales Office. For QTP devices, any special marking adders are included in QTP price.

NOTES:
