

Welcome to [E-XFL.COM](https://www.e-xfl.com)

## What is "[Embedded - Microcontrollers](#)"?

"[Embedded - Microcontrollers](#)" refer to small, integrated circuits designed to perform specific tasks within larger systems. These microcontrollers are essentially compact computers on a single chip, containing a processor core, memory, and programmable input/output peripherals. They are called "embedded" because they are embedded within electronic devices to control various functions, rather than serving as standalone computers. Microcontrollers are crucial in modern electronics, providing the intelligence and control needed for a wide range of applications.

## Applications of "[Embedded - Microcontrollers](#)"

### Details

Product Status	Active
Core Processor	SH2A-FPU
Core Size	32-Bit Single-Core
Speed	144MHz
Connectivity	I <sup>2</sup> C, SCI, SD, SIO, SPI, USB
Peripherals	DMA, POR, PWM, WDT
Number of I/O	115
Program Memory Size	-
Program Memory Type	ROMless
EEPROM Size	-
RAM Size	1M x 8
Voltage - Supply (Vcc/Vdd)	1.1V ~ 3.6V
Data Converters	A/D 8x10b
Oscillator Type	External
Operating Temperature	-20°C ~ 85°C (TA)
Mounting Type	Surface Mount
Package / Case	208-LQFP
Supplier Device Package	208-LFQFP (28x28)
Purchase URL	<a href="https://www.e-xfl.com/product-detail/renesas-electronics-america/r5s72642w144fp-u0">https://www.e-xfl.com/product-detail/renesas-electronics-america/r5s72642w144fp-u0</a>

[Legend]

X: Don't care

Note: \* After power-on reset, 0 is output until TIOR is set.

Bit	Bit Name	Initial Value	R/W	Description
1	RDF	0	R/(W)*	<p>Receive FIFO Data Full</p> <p>Indicates that receive data has been transferred to the receive FIFO data register (SCFRDR), and the quantity of data in SCFRDR has become more than the receive trigger number specified by the RTRG[1:0] bits in the FIFO control register (SCFCR).</p> <p>0: The quantity of transmit data written to SCFRDR is less than the specified receive trigger number</p> <p>[Clearing conditions]</p> <ul style="list-style-type: none"> <li>• RDF is cleared to 0 by a power-on reset, standby mode</li> <li>• RDF is cleared to 0 when the SCFRDR is read until the quantity of receive data in SCFRDR becomes less than the specified receive trigger number after 1 is read from RDF and then 0 is written</li> <li>• RDF is cleared to 0 when the direct memory access controller is activated by receive FIFO data full interrupt (RXI) and read SCFRDR until the quantity of receive data in SCFRDR becomes less than the specified receive trigger number</li> </ul> <p>1: The quantity of receive data in SCFRDR is more than the specified receive trigger number</p> <p>[Setting condition]</p> <ul style="list-style-type: none"> <li>• RDF is set to 1 when a quantity of receive data more than the specified receive trigger number is stored in SCFRDR*<sup>1</sup></li> </ul> <p>Note: 1. As SCFTDR is a 16-byte FIFO register, the maximum quantity of data that can be read when RDF is 1 becomes the specified receive trigger number. If an attempt is made to read after all the data in SCFRDR has been read, the data is undefined. The quantity of receive data in SCFRDR is indicated by the lower 8 bits of SCFDR.</p>

### 15.3.12 Line Status Register (SCLSR)

The CPU can always read or write to SCLSR, but cannot write 1 to the ORER flag. This flag can be cleared to 0 only if it has first been read (after being set to 1).

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	ORER
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R/(W)*

Note: \* Only 0 can be written to clear the flag after 1 is read.

Bit	Bit Name	Initial Value	R/W	Description
15 to 1	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
0	ORER	0	R/(W)*	<p>Overrun Error</p> <p>Indicates the occurrence of an overrun error.</p> <p>0: Receiving is in progress or has ended normally*<sup>1</sup></p> <p>[Clearing conditions]</p> <ul style="list-style-type: none"> <li>ORER is cleared to 0 when the chip is a power-on reset</li> <li>ORER is cleared to 0 when 0 is written after 1 is read from ORER.</li> </ul> <p>1: An overrun error has occurred*<sup>2</sup></p> <p>[Setting condition]</p> <ul style="list-style-type: none"> <li>ORER is set to 1 when the next serial receiving is finished while the receive FIFO is full of 16-byte receive data.</li> </ul> <p>Notes:</p> <ol style="list-style-type: none"> <li>Clearing the RE bit to 0 in SCSCR does not affect the ORER bit, which retains its previous value.</li> <li>The receive FIFO data register (SCFRDR) retains the data before an overrun error has occurred, and the next received data is discarded. When the ORER bit is set to 1, the next serial reception cannot be continued.</li> </ol>

### 16.3.4 Status Register (SPSR)

SPSR indicates the operating status.

Bit:	7	6	5	4	3	2	1	0
	SPRF	TEND	SPTEF	—	—	MODF	—	OVRF
Initial value:	0	1	1	0	0	0	0	0
R/W:	R	R	R	R	R	R/(W)*	R	R/(W)*

Note: \* Only 0 can be written to clear the flag after reading 1.

Bit	Bit Name	Initial Value	R/W	Description
7	SPRF	0	R	<p>Receive Buffer Full Flag</p> <p>Indicates that the number of receive data units in the receive buffer (SPRX) is equal to or greater than the receive buffer data triggering number specified in the buffer control register (SPBFCR).</p> <p>0: The number of receive data units in the receive buffer is less than the receive buffer data triggering number.</p> <p>1: The number of receive data units in the receive buffer is equal to or greater than the receive buffer data triggering number.</p> <p>[Clearing conditions]</p> <ul style="list-style-type: none"> <li>The receive buffer data is read until the number of data units in the receive buffer becomes less than the specified receive buffer data triggering number.</li> <li>Receive buffer data reset is enabled.</li> <li>Power-on reset</li> </ul> <p>[Setting condition]</p> <ul style="list-style-type: none"> <li>The number of data units in the receive buffer is equal to or greater than the specified receive buffer data triggering number.</li> </ul>

Bit	Bit Name	Initial Value	R/W	Description

This value will change as the data is copied to the shift register, regardless of whether the data is written to SSITDR.</p>
3, 2	RCHNO [1:0]	00	R	<p>Receive Channel Number</p> <p>These bits show the current channel number.</p> <p>These bits indicate which channel the data in SSIRDR currently represents. This value will change as the data in SSIRDR is updated from the shift register.</p>

Bit	Bit Name	Initial Value	R/W	Description
1	TXRST	0	R/W	<p>Transmit Reset</p> <p>0: Does not reset transmit operation</p> <p>1: Resets transmit operation</p> <ul style="list-style-type: none"> <li>This bit setting becomes valid immediately. This bit should be cleared to 0 before setting the register to be initialized.</li> <li>When the 1 setting for this bit becomes valid, this module immediately sets the SIOFTxD pin output to 1, and initializes the following registers and data: <ul style="list-style-type: none"> <li>SITDR</li> <li>Valid data in transmit FIFO</li> <li>The TFEMP and TDREQ bits in SISTR</li> <li>The TXE bit</li> </ul> </li> </ul> <p>Note: Set this bit to 1 for more than one transfer clock period.</p>
0	RXRST	0	R/W	<p>Receive Reset</p> <p>0: Does not reset receive operation</p> <p>1: Resets receive operation</p> <ul style="list-style-type: none"> <li>This bit setting becomes valid immediately. This bit should be cleared to 0 before setting the register to be initialized.</li> <li>When the 1 setting for this bit becomes valid, this module immediately disables reception from the SIOFRxD pin, and initializes the following registers and data: <ul style="list-style-type: none"> <li>SIRDR</li> <li>Valid data in receive FIFO</li> <li>The RFFUL and RDREQ bits in SISTR</li> <li>The RXE bit</li> </ul> </li> </ul> <p>Note: Set this bit to 1 for more than one transfer clock period.</p>

### 19.3.4 Receive Data Register (SIRDAR)

SIRDAR reads receive data of this module. SIRDAR stores data in the receive FIFO.

SIRDAR is initialized by a receive reset caused by the RXRST bit in SICTR.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	SIRDAR[15:0]															
Initial Value:	Undefined	Undefined	Undefined	Undefined	Undefined	Undefined	Undefined	Undefined	Undefined	Undefined	Undefined	Undefined	Undefined	Undefined	Undefined	Undefined
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R
Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	SIRDAR[15:0]															
Initial Value:	Undefined	Undefined	Undefined	Undefined	Undefined	Undefined	Undefined	Undefined	Undefined	Undefined	Undefined	Undefined	Undefined	Undefined	Undefined	Undefined
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 16	SIRDAR[15:0]	Undefined	R	<b>Left-Channel Receive Data</b> Store data received from the SIOFRxD pin as left-channel data. The position of the left-channel data in the receive frame is specified by the RDLA bit in SIRDAR. <ul style="list-style-type: none"> <li>These bits are valid only when the RDLE bit in SIRDAR is set to 1.</li> </ul>
15 to 0	SIRDAR[15:0]	Undefined	R	<b>Right-Channel Receive Data</b> Store data received from the SIOFRxD pin as right-channel data. The position of the right-channel data in the receive frame is specified by the RDRA bit in SIRDAR. <ul style="list-style-type: none"> <li>These bits are valid only when the RDRE bit in SIRDAR is set to 1.</li> </ul>

### 19.3.8 Clock Select Register (SISCR)

SISCR sets the serial clock generation conditions for the master clock. SISCR can be specified when the TRMD1 and TRMD0 bits in SIMDR are specified as B'10.

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	MSSEL	-	-	BRPS4	BRPS3	BRPS2	BRPS1	BRPS0	-	-	-	-	-	BRDV2	BRDV1	BRDV0
Initial Value:	1	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R/W	R	R	R/W	R/W	R/W	R/W	R/W	R	R	R	R	R	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
15	MSSEL	1	R/W	Master Clock Source Selection 0: Uses AUDIO_X1 as the master clock 1: Uses AUDIO_CLK as the master clock The master clock is the clock input to the baud rate generator.
14, 13	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
12	BRPS4	0	R/W	Prescaler Setting
11	BRPS3	0	R/W	Set the master clock division ratio according to the count value of the prescaler of the baud rate generator.
10	BRPS2	0	R/W	The range of settings is from B'00000 ( $\times 1/1$ ) to B'11111 ( $\times 1/32$ ).
9	BRPS1	0	R/W	
8	BRPS0	0	R/W	
7 to 3	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.

## Section 20 Controller Area Network

### 20.1 Summary

#### 20.1.1 Overview

This document primarily describes the programming interface for the controller area network (Renesas CAN Time Trigger Level 1) module. It serves to facilitate the hardware/software interface so that engineers involved in this module implementation can ensure the design is successful.

Deep standby mode can be canceled by change on CRxn (PJ3, PJ1) pin. For details, refer to section 33, Power-Down Modes.

#### 20.1.2 Scope

The CAN Data Link Controller function is not described in this document. It is the responsibility of the reader to investigate the CAN Specification Document (see references). The interfaces from the CAN Controller are described, in so far as they pertain to the connection with the User Interface.

The programming model is described in some detail. It is not the intention of this document to describe the implementation of the programming interface, but to simply present the interface to the underlying CAN functionality.

The document places no constraints upon the implementation of this module in terms of process, packaging or power supply criteria. These issues are resolved where appropriate in implementation specifications.

#### 20.1.3 Audience

In particular this document provides the design reference for software authors who are responsible for creating a CAN application using this module.

In the creation of this module user interface LSI engineers must use this document to understand the hardware requirements.

#### 20.1.4 References

1. CAN Specification Version 2.0 part A, Robert Bosch GmbH, 1991
2. CAN Specification Version 2.0 part B, Robert Bosch GmbH, 1991

When this module recognises the end of the Arbitration field while receiving a message, it starts comparing the received identifier to the identifiers set in the Mailboxes, starting from Mailbox-31 down to Mailbox-0. It first checks the MBC if it is configured as a receive box, and reads LAFM, and reads the CAN-ID of Mailbox-31 (if configured as receive) to finally compare them to the received ID. If it does not match, the same check takes place at Mailbox-30 (if configured as receive). Once this module finds a matching identifier, it stores the number of Mailbox-[N] into an internal buffer, stops the search, and goes back to idle state, waiting for the EndOfFrame (EOF) to come. When the 6<sup>th</sup> bit of EOF is notified by the CAN Interface logic, the received message is written or abandoned, depending on the NMC bit. No modification of configuration during communication is allowed. Entering Halt Mode is one of ways to modify configuration. If it is written into the corresponding Mailbox, including the CAN-ID, i.e., there is a possibility that the CAN-ID is overwritten by a different CAN-ID of the received message due to the LAFM used. This also implies that, if the identifier of a received message matches to ID + LAFM of 2 or more Mailboxes, the higher numbered Mailbox will always store the relevant messages and the lower numbered Mailbox will never receive messages. Therefore, the settings of the identifiers and LAFMs need to be carefully selected.

With regards to the reception of data and remote frames described in the above flow diagram the clearing of the UMSR flag after the reading of IRR is to detect situations where a message is overwritten by a new incoming message stored in the same mailbox (if its NMC = 1) while the interrupt service routine is running. If during the final check of UMSR a overwrite condition is detected the message needs to be discarded and read again.

In case UMSR is set and the Mailbox is configured for overrun (NMC = 0) the message is still valid, however it is obsolete as it is not reflecting the latest message monitored on the CAN Bus.

Please access the full Mailbox content before clearing the related RXPR/RFPR flag.

Please note that in the case a received remote frame is overwritten by a data frame, both the remote frame receive interrupt (IRR2) and data frame received interrupt (IRR1) and also the Receive Flags (RXPR and RFPR) are set. In an analogous way, the overwriting of a data frame by a remote frame, leads to setting both IRR2 and IRR1.

When a message is received and stored into a Mailbox all the fields of the data not received are stored as zero. The same applies when a standard frame is received. The extended identifier part (EXTID[17:0]) is written as zero.

### 26.3.8 FIFO Port Select Registers (CFIFOSEL, D0FIFOSEL, D1FIFOSEL)

CFIFOSEL, D0FIFOSEL and D1FIFOSEL are registers that assign the pipe to the FIFO port, and control access to the corresponding port.

The same pipe should not be specified by the CURPIPE bits in CFIFOSEL, D0FIFOSEL and D1FIFOSEL. When the CURPIPE bits in D0FIFOSEL and D1FIFOSEL are cleared to B'000, no pipe is selected.

The pipe number should not be changed while the DMA transfer is enabled.

These registers are initialized by a power-on reset.

#### (1) CFIFOSEL

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

0	PIPE0NRDYE	0	R/W	NRDY Interrupt Enable for PIPE0 0: Interrupt output disabled 1: Interrupt output enabled

### 26.3.14 BEMP Interrupt Enable Register (BEMPENB)

BEMPENB is a register that enables or disables the BEMP bit in INTSTS0 to be set to 1 when the BEMP interrupt is detected for each pipe.

On detecting the BEMP interrupt for the pipe corresponding to the bit in this register that has been set to 1, this module sets 1 to the corresponding PIPEBEMP bit in BEMPSTS and the BEMP bit in INTSTS0, and generates the BEMP interrupt.

While at least one PIPEBEMP bit in BEMPSTS indicates 1, this module generates the BEMP interrupt when the corresponding interrupt enable bit in BEMPENB is modified from 0 to 1.

This register is initialized by a power-on reset.

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	PIPE9 BEMPE	PIPE8 BEMPE	PIPE7 BEMPE	PIPE6 BEMPE	PIPE5 BEMPE	PIPE4 BEMPE	PIPE3 BEMPE	PIPE2 BEMPE	PIPE1 BEMPE	PIPE0 BEMPE
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
15 to 10	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
9	PIPE9BEMPE	0	R/W	BEMP Interrupt Enable for PIPE9 0: Interrupt output disabled 1: Interrupt output enabled

27.7.10 Video Base Address Register (VIDEO\_BASEADR)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	VIDEO_BASEADR[31:16]															
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	VIDEO_BASEADR[15:0]															
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 0	VIDEO_BASEADR [31:0]	H'00000000	R/W	<p>These bits specify the base address of the destination where video data is to be written to. According to the BURST_MODE_MAIN bit setting in the VIDEO_MODE register, the lower bits should be set as follows.</p> <p>In 16-byte burst transfer: The lower four bits should always be 0000.</p> <p>In 128-byte burst transfer: The lower seven bits should always be 000_0000.</p>

### 27.7.34 Vertical Sync Signal Timing Control Register (PANEL\_VSYNC\_TIM)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	-	-	-	VSYNC_START[9:0]									
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	-	-	-	-	VSYNC_END[9:0]									
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	1
R/W:	R	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 26	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
25 to 16	VSYNC_START [9:0]	H'000	R/W	These bits specify in number of lines the interval between the reference vertical sync signal and the point where the vertical sync signal (VSYNC) for panel is set to 1.
15 to 10	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
9 to 0	VSYNC_END [9:0]	H'001	R/W	These bits specify in number of lines the interval between the reference vertical sync signal and the point where the vertical sync signal (VSYNC) for panel is cleared to 0.

**Note:** Be sure to satisfy  $VSYNC\_START \neq VSYNC\_END$ ; otherwise, correct operation is not guaranteed.

## (1) Video Display Position and Register Settings

As the display block does not have frame memory, specify through registers the vertical start position and number of line buffers for the video according to the panel specifications (HSYNC cycle). For the vertical video position, first calculate the register settings to place the video along the top end, and then calculate the settings to place the video at the center or along the bottom end.

### (a) Register settings for vertical position

**Step 1:** Calculate the settings to place the video along the top end.

**Table 27.20 List of Parameters (registers are shaded in grey)**

	Register Name or Value	Unit
(1) T (Hsync_in): HSYNC cycle of the input video	0.064	ms
(2) Vertical size of the valid video	VIDEO_SIZE[24:16]	Line
(3) T (Hsync_out): HSYNC cycle for the panel	Depends on the panel specifications	ms
(4) Vertical size of the video to be displayed	VIDEO_DISP_SIZE[24:16]	Line
(5) Line buffer margin	6 or a greater value	Line
(6) Vertical start position of the valid video in the TOP field	VIDEO_VSTART[24:16]	Line
(7) Vertical start position of the valid video in the BOTTOM field	VIDEO_VSTART[8:0]	Line
(8) Number of lines between the reference Vsync and the displayable area	Depends on the panel specifications	Line

## 35.5 Operation

### 35.5.1 PWM Operation

PWM waveforms are output from pins PWM1A to PWM1H and PWM2A to PWM2H as shown in figure 35.7.

#### (1) Initial Settings

Set the PWM output polarity in PWPR\_n; select the clock to be input to PWCNT\_n with the CKS2 to CKS0 bits in PWCRn; set the PWM conversion cycle in PWCYR\_n; and set the first frame of data in PWBFR\_nA, PWBFR\_nC, PWBFR\_nE, and PWBFR\_nG.

#### (2) Activation

When the CST bit in PWCR\_n is set to 1, PWCNT\_n starts counting up. On compare match between PWCNT\_n and PWCYR\_n, data is transferred from the buffer register to the duty register and the CMF bit in PWCR\_n is set to 1. At the same time, if the IE bit in PWCR\_n has been set to 1, an interrupt can be requested or the direct memory access controller can be activated.

#### (3) Waveform Output

The PWM outputs selected by the OTS bits in PWDTR\_nA, PWDTR\_nC, PWDTR\_nE, and PWDTR\_nG go high when a compare match occurs between PWCNT\_n and PWCYR\_n. The PWM outputs not selected by the OTS bit are low. When a compare match occurs between PWCNT\_n and PWDTR\_nA, PWDTR\_nC, PWDTR\_nE, or PWDTR\_nG, the corresponding PWM output goes low. If the corresponding bit in PWPR\_n is set to 1, the output is inverted.
