Understanding Embedded - FPGAs (Field Programmable Gate Array)

Embedded - FPGAs, or Field Programmable Gate Arrays, are advanced integrated circuits that offer unparalleled flexibility and performance for digital systems. Unlike traditional fixed-function logic devices, FPGAs can be programmed and reprogrammed to execute a wide array of logical operations, enabling customized functionality tailored to specific applications. This reprogrammability allows developers to iterate designs quickly and implement complex functions without the need for custom hardware.

Applications of Embedded - FPGAs

The versatility of Embedded - FPGAs makes them indispensable in numerous fields. In telecommunications.

Notes:

1. Banks 4 and 5 of any Spartan-3 device in a VQ100 package do not support signal standards using V_{REF}.
2. The V_{CCO} level used for the GTL and GTLP standards must be no lower than the termination voltage (V_{TT}), nor can it be lower than the voltage at the I/O pad.
3. See Table 10 for a listing of the single-ended DCI standards.

Differential standards employ a pair of signals, one the opposite polarity of the other. The noise canceling (e.g., Common-Mode Rejection) properties of these standards permit exceptionally high data transfer rates. This section introduces the differential signaling capabilities of Spartan-3 devices.

Each device-package combination designates specific I/O pairs that are specially optimized to support differential standards. A unique “L-number”, part of the pin name, identifies the line-pairs associated with each bank (see Figure 40, page 112). For each pair, the letters ‘P’ and ‘N’ designate the true and inverted lines, respectively. For example, the pin names IO_L43P_7 and IO_L43N_7 indicate the true and inverted lines comprising the line pair L43 on Bank 7. The V_{CCO} lines provide current to the outputs. The V_{CCAUX} lines supply power to the differential inputs, making them independent of the V_{CCO} voltage for an I/O bank. The V_{REF} lines are not used. Select the V_{CCO} level to suit the desired differential standard according to Table 9.

In contrast, the 144-pin Thin Quad Flat Pack (TQ144) package and the 132-pin Chip-Scale Package (CP132) tie V_{CCO} together internally for the pair of banks on each side of the device. For example, the V_{CCO} Bank 0 and the V_{CCO} Bank 1 lines are tied together. The interconnected bank-pairs are 0/1, 2/3, 4/5, and 6/7. As a result, Spartan-3 devices in the CP132 and TQ144 packages support four independent V_{CCO} supplies.

Note: The CP132 package is discontinued. See http://www.xilinx.com/support/documentation /spartan-3_customer_notices.htm.

Spartan-3 FPGA Compatibility

Within the Spartan-3 family, all devices are pin-compatible by package. When the need for future logic resources outgrows the capacity of the Spartan-3 device in current use, a larger device in the same package can serve as a direct replacement. Larger devices may add extra V_{REF} and V_{CCO} lines to support a greater number of I/Os. In the larger device, more pins can convert from user I/Os to V_{REF} lines. Also, additional V_{CCO} lines are bonded out to pins that were “not connected” in the smaller device. Thus, it is important to plan for future upgrades at the time of the board’s initial design by laying out connections to the extra pins.

The Spartan-3 family is not pin-compatible with any previous Xilinx FPGA family or with other platforms among the Spartan-3 Generation FPGAs.

Rules Concerning Banks

When assigning I/Os to banks, it is important to follow the following V_{CCO} rules:

- Leave no V_{CCO} pins unconnected on the FPGA.
- Set all V_{CCO} lines associated with the (interconnected) bank to the same voltage level.
- The V_{CCO} levels used by all standards assigned to the I/Os of the (interconnected) bank(s) must agree. The Xilinx development software checks for this. Tables 8, 9, and 10 describe how different standards use the V_{CCO} supply.
- Only one of the following standards is allowed on outputs per bank: LVDS, LDT, LVDS_EXT, or RSDS. This restriction is for the eight banks in each device, even if the V_{CCO} levels are shared across banks, as in the CP132 and TQ144 packages.
- If none of the standards assigned to the I/Os of the (interconnected) bank(s) uses V_{CCO}, tie all associated V_{CCO} lines to 2.5V.
- In general, apply 2.5V to V_{CCO} Bank 4 from power-on to the end of configuration. Apply the same voltage to V_{CCO} Bank 5 during parallel configuration or a Readback operation. For information on how to program the FPGA using 3.3V signals and power, see the 3.3V-Tolerant Configuration Interface section.

If any of the standards assigned to the Inputs of the bank use V_{REF}, then observe the following additional rules:

- Connect *all* V_{REF} pins within the bank to the same voltage level.
- The V_{REF} levels used by all standards assigned to the Inputs of the bank must agree. The Xilinx development software checks for this. Tables 8 and 10 describe how different standards use the V_{REF} supply.

If none of the standards assigned to the Inputs of a bank use V_{REF} for biasing input switching thresholds, all associated V_{REF} pins function as User I/Os.

Exceptions to Banks Supporting I/O Standards

Bank 5 of any Spartan-3 device in a VQ100, CP132, or TQ144 package does not support DCI signal standards. In this case, bank 5 has neither VRN nor VRP pins.

Furthermore, banks 4 and 5 of any Spartan-3 device in a VQ100 package do not support signal standards using V_{REF} (see Table 8). In this case, the two banks do not have any V_{REF} pins.

Configuration is automatically initiated after power-on unless it is delayed by the user. INIT_B is an open-drain line that the FPGA holds Low during the clearing of the configuration memory. Extending the time that the pin is Low causes the configuration sequencer to wait. Thus, configuration is delayed by preventing entry into the phase where data is loaded.

The configuration process can also be initiated by asserting the PROG_B pin. The end of the memory-clearing phase is signaled by the INIT_B pin going High. At this point, the configuration data is written to the FPGA. The FPGA pulses the Global Set/Reset (GSR) signal at the end of configuration, resetting all flip-flops. The completion of the entire process is signaled by the DONE pin going High.

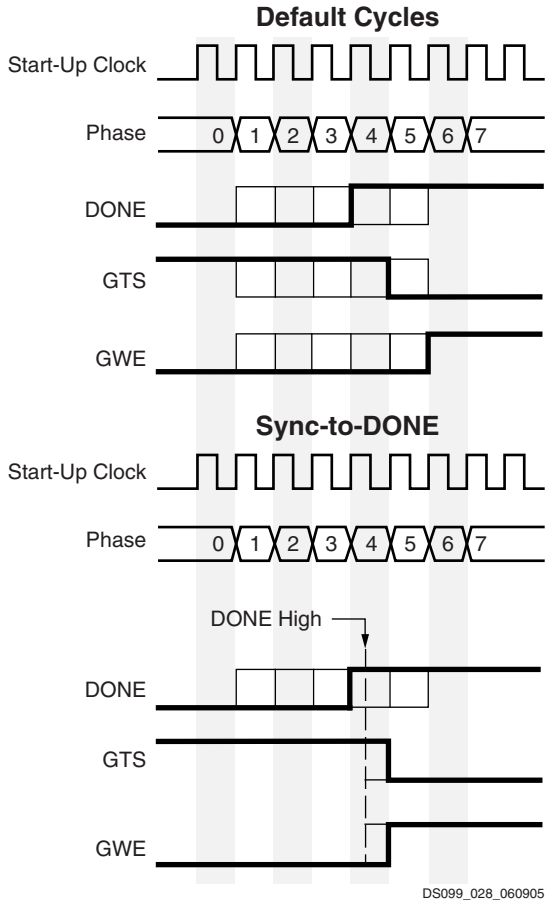

Figure 31: **Default Start-Up Sequence**

The default start-up sequence, shown in Figure 31, serves as a transition to the User mode. The default start-up sequence is that one CCLK cycle after DONE goes High, the Global Three-State signal (GTS) is released. This permits device outputs to which signals have been assigned to become active. One CCLK cycle later, the Global Write Enable (GWE) signal is released. This permits the internal storage elements to begin changing state in response to the design logic and the user clock.

The relative timing of configuration events can be changed via the BitGen options in the Xilinx development software. In addition, the GTS and GWE events can be made dependent on the DONE pins of multiple devices all going High, forcing the devices to start synchronously. The sequence can also be paused at any stage, until lock has been achieved on any DCM.

Readback

Using Slave Parallel mode, configuration data from the FPGA can be read back. Readback is supported only in the Slave Parallel and Boundary-Scan modes.

Along with the configuration data, it is possible to read back the contents of all registers, distributed RAM, and block RAM resources. This capability is used for real-time debugging.

		$V_{CCO} < 3.0V$		–	-	±10	µA
C_{IN}	Input capacitance			3	-	10	pF

Notes:

1. The numbers in this table are based on the conditions set forth in Table 32.
2. The I_L specification applies to every I/O pin throughout power-on as long as the voltage on that pin stays between the absolute V_{IN} minimum and maximum values (Table 28). For hot-swap applications, at the time of card connection, be sure to keep all I/O voltages within this range before applying V_{CCO} power. Consider applying V_{CCO} power before connecting the signal lines, to avoid turning on the ESD protection diodes, shown in Module 2: Figure 7, page 11. When the FPGA is completely unpowered, the I/O pins are high impedance, but there is a path through the upper and lower ESD protection diodes.
3. This parameter is based on characterization. The pull-up resistance $R_{PU} = V_{CCO} / I_{RPU}$. The pull-down resistance $R_{PD} = V_{IN} / I_{RPD}$. Spartan-3 family values for both resistances are stronger than they have been for previous FPGA families.
4. For single-ended signals that are placed on a differential-capable I/O, V_{IN} of –0.2V to –0.3V is supported but can cause increased leakage between the two pins. See the *Parasitic Leakage* section in UG331, *Spartan-3 Generation FPGA User Guide*.

Notes:

1. The numbers in this table are based on the conditions set forth in Table 32 and Table 37.
2. Output voltage measurements for all differential standards are made with a termination resistor (R_T) of 100Ω across the N and P pins of the differential signal pair.
3. Mask revision E devices have tighter output ranges but can be used in any design that was in a previous revision. See Mask and Fab Revisions, page 58.
4. This value must be compatible with the receiver to which the FPGA's output pair is connected.
5. Each LVPECL_25 or BLVDS_25 output-pair requires three external resistors for proper output operation as shown in Figure 34. Each LVPECL_25 or BLVDS_25 input-pair uses a 100W termination resistor at the receiver.
6. Only one of the differential standards RSDS_25, LDT_25, LVDS_25, and LVDSEXT_25 may be used for outputs within a bank. Each differential standard input-pair requires an external 100Ω termination resistor.

Notes:

1. The numbers in this table are based on the operating conditions set forth in Table 32 and Table 58.
2. DLL specifications apply when any of the DLL outputs (CLK0, CLK90, CLK180, CLK270, CLK2X, CLK2X180, or CLKDV) are in use.
3. Only mask revision 'E' and later devices (see Mask and Fab Revisions, page 58) and all revisions of the XC3S50 and the XC3S1000 support DLL feedback using the CLK2X output. For all other Spartan-3 devices, use feedback from the CLK0 output (instead of the CLK2X output) and set the CLK_FEEDBACK attribute to 1X.
4. Indicates the maximum amount of output jitter that the DCM adds to the jitter on the CLKIN input.
5. This specification only applies if the attribute DUTY_CYCLE_CORRECTION = TRUE.

Notes:

1. DFS specifications apply when either of the DFS outputs (CLKFX or CLKFX180) are used.
2. If both DFS and DLL outputs are used on the same DCM, follow the more restrictive CLKIN_FREQ_DLL specifications in Table 58.
3. CLKIN input jitter beyond these limits may cause the DCM to lose lock.

Revision History

Date	Version	Description
04/11/03	1.0	Initial Xilinx release.
07/11/03	1.1	Extended Absolute Maximum Rating for junction temperature in Table 28. Added numbers for typical quiescent supply current (Table 34) and DLL timing.
02/06/04	1.2	Revised V_{IN} maximum rating (Table 28). Added power-on requirements (Table 30), leakage current number (Table 33), and differential output voltage levels (Table 38) for Rev. 0. Published new quiescent current numbers (Table 34). Updated pull-up and pull-down resistor strengths (Table 33). Added LVDCI_DV2 and LVPECL standards (Table 37 and Table 38). Changed CCLK setup time (Table 66 and Table 67).
03/04/04	1.3	Added timing numbers from v1.29 speed files as well as DCM timing (Table 58 through Table 63).
08/24/04	1.4	Added reference to errata documents on page 49. Clarified Absolute Maximum Ratings and added ESD information (Table 28). Explained V_{CCO} ramp time measurement (Table 30). Clarified I_L specification (Table 33). Updated quiescent current numbers and added information on power-on and surplus current (Table 34). Adjusted V_{REF} range for HSTL_III and HSTL_I_18 and changed V_{IH} min for LVCMOS12 (Table 35). Added note limiting V_{TT} range for SSTL2_II signal standards (Table 36). Calculated V_{OH} and V_{OL} levels for differential standards (Table 38). Updated Switching Characteristics with speed file v1.32 (Table 40 through Table 48 and Table 51 through Table 56). Corrected IOB test conditions (Table 41). Updated DCM timing with latest characterization data (Table 58 through Table 62). Improved DCM CLKIN pulse width specification (Table 58). Recommended use of Virtex-II FPGA Jitter calculator (Table 61). Improved DCM PSCLK pulse width specification (Table 62). Changed Phase Shifter lock time parameter (Table 63). Because the BitGen option Centered_x#_y# is not necessary for Variable Phase Shift mode, removed BitGen command table and referring text. Adjusted maximum CCLK frequency for the slave serial and parallel configuration modes (Table 66). Inverted CCLK waveform (Figure 37). Adjusted JTAG setup times (Table 68).
12/17/04	1.5	Updated timing parameters to match v1.35 speed file. Improved V_{CCO} ramp time specification (Table 30). Added a note limiting the rate of change of V_{CCAUX} (Table 32). Added typical quiescent current values for the XC3S2000, XC3S4000, and XC3S5000 (Table 34). Increased I_{OH} and I_{OL} for SSTL2-I and SSTL2-II standards (Table 36). Added SSO guidelines for the VQ, TQ, and PQ packages as well as edited SSO guidelines for the FT and FG packages (Table 50). Added maximum CCLK frequencies for configuration using compressed bitstreams (Table 66 and Table 67). Added specifications for the HSLVDCI standards (Table 35, Table 36, Table 44, Table 47, Table 48, and Table 50).
08/19/05	1.6	Updated timing parameters to match v1.37 speed file. All Spartan-3 FPGA part types, except XC3S5000, promoted to Production status. Removed V_{CCO} ramp rate restriction from all mask revision 'E' and later devices (Table 30). Added equivalent resistance values for internal pull-up and pull-down resistors (Table 33). Added worst-case quiescent current values for XC3S2000, XC3S4000, XC3S5000 (Table 34). Added industrial temperature range specification and improved typical quiescent current values (Table 34). Improved the DLL minimum clock input frequency specification from 24 MHz down to 18 MHz (Table 58). Improved the DFS minimum and maximum clock output frequency specifications (Table 60, Table 61). Added new miscellaneous DCM specifications (Table 64), primarily affecting Industrial temperature range applications. Updated Simultaneously Switching Output Guidelines and Table 50 for QFP packages. Added information on SSTL18_II I/O standard and timing to support DDR2 SDRAM interfaces. Added differential (or complementary single-ended) DIFF_HSTL_II_18 and DIFF_SSTL2_II I/O standards, including DCI terminated versions. Added electro-static discharge (ESD) data for the XC3S2000 and larger FPGAs (Table 28). Added link to Spartan-3 FPGA errata notices and how to receive automatic notifications of data sheet or errata changes.
04/03/06	2.0	Upgraded Module 3, removing Preliminary status. Moved XC3S5000 to Production status in Table 39. Finalized I/O timing on XC3S5000 for v1.38 speed files. Added minimum timing values for various logic and I/O paths. Corrected labels for R_{PU} and R_{PD} and updated R_{PD} conditions for in Table 33. Added final mask revision 'E' specifications for LVDS_25, RSDS_25, LVDSEXT_25 differential outputs to Table 38. Added BLVDS termination requirements to Figure 34. Improved recommended Simultaneous Switching Outputs (SSOs) limits in Table 50 for quad-flat packaged based on silicon testing using devices soldered on a printed circuit board. Updated Note 2 in Table 63. Updated Note 6 in Table 30. Added INIT_B minimum pulse width specification, T_{INIT}, to Table 65.
04/26/06	2.1	Updated document links.

User I/Os by Bank

Note: The FG(G)1156 package is discontinued. See http://www.xilinx.com/support/documentation/spartan-3_customer_notices.htm.

Table 111 indicates how the available user-I/O pins are distributed between the eight I/O banks for the XC3S4000 in the FG1156 package. Similarly, Table 112 shows how the available user-I/O pins are distributed between the eight I/O banks for the XC3S5000 in the FG1156 package.
