
Welcome to E-XFL.COM

What is "Embedded - Microcontrollers"?

"Embedded - Microcontrollers" refer to small, integrated circuits designed to perform specific tasks within larger systems. These microcontrollers are essentially compact computers on a single chip, containing a processor core, memory, and programmable input/output peripherals. They are called "embedded" because they are embedded within electronic devices to control various functions, rather than serving as standalone computers. Microcontrollers are crucial in modern electronics, providing the intelligence and control needed for a wide range of applications.

Applications of "Embedded - Microcontrollers"

Details	
Product Status	Active
Core Processor	eZ8
Core Size	8-Bit
Speed	20MHz
Connectivity	IrDA, UART/USART
Peripherals	Brown-out Detect/Reset, LED, LVD, POR, PWM, WDT
Number of I/O	6
Program Memory Size	4KB (4K x 8)
Program Memory Type	FLASH
EEPROM Size	128 x 8
RAM Size	1K x 8
Voltage - Supply (Vcc/Vdd)	2.7V ~ 3.6V
Data Converters	-
Oscillator Type	Internal
Operating Temperature	0°C ~ 70°C (TA)
Mounting Type	Through Hole
Package / Case	8-DIP (0.300", 7.62mm)
Supplier Device Package	-
Purchase URL	https://www.e-xfl.com/product-detail/zilog/z8f041apb020sg

Pin Description

The Z8 Encore! XP F082A Series products are available in a variety of packages styles and pin configurations. This chapter describes the signals and available pin configurations for each of the package styles. For information about physical package specifications, see the Packaging chapter on page 245.

Available Packages

The following package styles are available for each device in the Z8 Encore! XP F082A Series product line:

- SOIC: 8-, 20- and 28-pin
- PDIP: 8-, 20- and 28-pin
- SSOP: 20- and 28- pin
- QFN 8-pin (MLF-S, a QFN-style package with an 8-pin SOIC footprint)

In addition, the Z8 Encore! XP F082A Series devices are available both with and without advanced analog capability (ADC, temperature sensor and op amp). Devices Z8F082A, Z8F042A, Z8F022A and Z8F012A contain the advanced analog, while devices Z8F081A, Z8F041A, Z8F021A and Z8F011A do not have the advanced analog capability.

Pin Configurations

Figure 2 through Figure 4 display the pin configurations for all the packages available in the Z8 Encore! XP F082A Series. See Table 2 on page 10 for a description of the signals. The analog input alternate functions (ANA*x*) are not available on the Z8F081A, Z8F041A, Z8F021A and Z8F011A devices. The analog supply pins (AV_{DD} and AV_{SS}) are also not available on these parts and are replaced by PB6 and PB7.

At reset, all Port A, B and C pins default to an input state. In addition, any alternate functionality is not enabled, so the pins function as general purpose input ports until programmed otherwise. At powerup, the PD0 pin defaults to the $\overline{\text{RESET}}$ alternate function.

The pin configurations listed are preliminary and subject to change based on manufacturing limitations.

Table 2. Signal Descriptions (Continued)

Signal Mnemonic	I/O	Description
Analog		
ANA[7:0]	I	Analog Port. These signals are used as inputs to the analog-to-digital converter (ADC).
VREF	I/O	Analog-to-digital converter reference voltage input, or buffered output for internal reference.
Low-Power Operational Amplifier (LPO)		
AMPINP/AMPINN	I	LPO inputs. If enabled, these pins drive the positive and negative amplifier inputs respectively.
AMPOUT	O	LPO output. If enabled, this pin is driven by the on-chip LPO.
Oscillators		
XIN	I	External Crystal Input. This is the input pin to the crystal oscillator. A crystal can be connected between it and the X_{OUT} pin to form the oscillator. In addition, this pin is used with external RC networks or external clock drivers to provide the system clock.
X_{OUT}	O	External Crystal Output. This pin is the output of the crystal oscillator. A crystal can be connected between it and the **XIN** pin to form the oscillator.
Clock Input		
CLKIN	I	Clock Input Signal. This pin may be used to input a TTL-level signal to be used as the system clock.
LED Drivers		
LED	O	Direct LED drive capability. All port C pins have the capability to drive an LED without any other external components. These pins have programmable drive strengths set by the GPIO block.
On-Chip Debugger		
DBG	I/O	Debug. This signal is the control and data input and output to and from the On-Chip Debugger. **Caution:** The DBG pin is open-drain and requires a pull-up resistor to ensure proper operation.

Notes:
1. PB6 and PB7 are only available in 28-pin packages without ADC. In 28-pin packages with ADC, they are replaced by AV_{DD} and AV_{SS}.
2. The AV_{DD} and AV_{SS} signals are available only in 28-pin packages with ADC. They are replaced by PB6 and PB7 on 28-pin packages without ADC.

Table 3. Pin Characteristics (20- and 28-pin Devices)

Symbol Mnemonic	Direction	Reset Direction	Active Low or Active High	Tristate Output	Internal Pull-up or Pull-down	Schmitt-Trigger Input	Open Drain Output	5 V Tolerance
AVDD	N/A	N/A	N/A	N/A	N/A	N/A	N/A	N/A
AVSS	N/A	N/A	N/A	N/A	N/A	N/A	N/A	NA
DBG	I/O	I	N/A	Yes	Yes	Yes	Yes	No
PA[7:0]	I/O	I	N/A	Yes	Programmable Pull-up	Yes	Yes, Programmable	PA[7:2] unless pull-ups enabled
PB[7:0]	I/O	I	N/A	Yes	Programmable Pull-up	Yes	Yes, Programmable	PB[7:6] unless pull-ups enabled
PC[7:0]	I/O	I	N/A	Yes	Programmable Pull-up	Yes	Yes, Programmable	PC[7:3] unless pull-ups enabled
RESET/ PD0	I/O	I/O (defaults to RESET)	Low (in Reset mode)	Yes (PD0 only)	Programmable for PD0; always on for RESET	Yes	Programmable for PD0; always on for RESET	Yes, unless pull-ups enabled
VDD	N/A	N/A	N/A	N/A			N/A	N/A
VSS	N/A	N/A	N/A	N/A			N/A	N/A

Note: PB6 and PB7 are available only in those devices without ADC.

Port A–D Address Registers

The Port A–D Address registers select the GPIO port functionality accessible through the Port A–D Control registers. The Port A–D Address and Control registers combine to provide access to all GPIO port controls; see Tables 18 and 19.

Table 18. Port A–D GPIO Address Registers (P*x*ADDR)

Bit	7	6	5	4	3	2	1	0
Field	PADDR[7:0]							
RESET	00H							
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Address	FD0H, FD4H, FD8H, FDCH							

Bit	Description
[7:0] PADDRx	**Port Address** The Port Address selects one of the subregisters accessible through the Port Control Register.

Note: x indicates the specific GPIO port pin number (7–0).

Table 19. Port A–D GPIO Address Registers by Bit Description

PADDR[7:0]	Port Control Subregister accessible using the Port A–D Control Registers
00H	No function. Provides some protection against accidental port reconfiguration.
01H	Data Direction.
02H	Alternate Function.
03H	Output Control (Open-Drain).
04H	High Drive Enable.
05H	Stop Mode Recovery Source Enable.
06H	Pull-up Enable.
07H	Alternate Function Set 1.
08H	Alternate Function Set 2.
09H–FFH	No function.

Port A–D Control Registers

The Port A–D Control registers set the GPIO port operation. The value in the corresponding Port A–D Address Register determines which subregister is read from or written to by a Port A–D Control Register transaction; see Table 20.

Table 20. Port A–D Control Registers (PxCTL)

Bit	7	6	5	4	3	2	1	0
Field	PCTL							
RESET	00H							
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Address	FD1H, FD5H, FD9H, FDDH							

Bit	Description
[7:0] PCTLx	**Port Control** The Port Control Register provides access to all subregisters that configure the GPIO port operation.

Note: x indicates the specific GPIO port pin number (7–0).

Port A–D Data Direction Subregisters

The Port A–D Data Direction subregister is accessed through the Port A–D Control Register by writing 01H to the Port A–D Address Register; see Table 21.

Table 21. Port A–D Data Direction Subregisters (PxDD)

Bit	7	6	5	4	3	2	1	0
Field	DD7	DD6	DD5	DD4	DD3	DD2	DD1	DD0
RESET	1	1	1	1	1	1	1	1
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Address	If 01H in Port A–D Address Register, accessible through the Port A–D Control Register							

Bit	Description
[7:0] DDx	**Data Direction** These bits control the direction of the associated port pin. Port Alternate Function operation overrides the Data Direction Register setting. 0 = Output. Data in the Port A–D Output Data Register is driven onto the port pin. 1 = Input. The port pin is sampled and the value written into the Port A–D Input Data Register. The output driver is tristated.

Note: x indicates the specific GPIO port pin number (7–0).

Caution: The frequency of the comparator output signal must not exceed one-fourth the system clock frequency. Further, the high or low state of the comparator output signal pulse must be no less than twice the system clock period. A shorter pulse may not be captured.

After reaching the reload value stored in the Timer Reload High and Low Byte registers, the timer generates an interrupt, the count value in the Timer High and Low Byte registers is reset to 0001H and counting resumes. Also, if the Timer Output alternate function is enabled, the Timer Output pin changes state (from Low to High or from High to Low) at timer Reload.

Observe the following steps for configuring a timer for COMPARATOR COUNTER Mode and initiating the count:

1. Write to the Timer Control Register to:
   - Disable the timer.
   - Configure the timer for COMPARATOR COUNTER Mode.
   - Select either the rising edge or falling edge of the comparator output signal for the count. This also sets the initial logic level (High or Low) for the Timer Output alternate function. However, the Timer Output function is not required to be enabled.
2. Write to the Timer High and Low Byte registers to set the starting count value. This action only affects the first pass in COMPARATOR COUNTER Mode. After the first timer Reload in COMPARATOR COUNTER Mode, counting always begins at the reset value of 0001H. Generally, in COMPARATOR COUNTER Mode the Timer High and Low Byte registers must be written with the value 0001H.
3. Write to the Timer Reload High and Low Byte registers to set the reload value.
4. If appropriate, enable the timer interrupt and set the timer interrupt priority by writing to the relevant interrupt registers.
5. If using the Timer Output function, configure the associated GPIO port pin for the Timer Output alternate function.
6. Write to the Timer Control Register to enable the timer.

In COMPARATOR COUNTER Mode, the number of comparator output transitions since the timer start is computed via the following equation:

Comparator Output Transitions = Current Count Value – Start Value

Table 63. UART Control 0 Register (U0CTL0)

Bit	7	6	5	4	3	2	1	0
Field	TEN	REN	CTSE	PEN	PSEL	SBRK	STOP	LBEN
RESET	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Address	F42H							

Bit	Description
[7] TEN	**Transmit Enable** This bit enables or disables the transmitter. The enable is also controlled by the $\overline{\text{CTS}}$ signal and the CTSE bit. If the $\overline{\text{CTS}}$ signal is Low and the CTSE bit is 1, the transmitter is enabled. 0 = Transmitter disabled. 1 = Transmitter enabled.
[6] REN	**Receive Enable** This bit enables or disables the receiver. 0 = Receiver disabled. 1 = Receiver enabled.
[5] CTSE	**CTS Enable** 0 = The $\overline{\text{CTS}}$ signal has no effect on the transmitter. 1 = The UART recognizes the $\overline{\text{CTS}}$ signal as an enable control from the transmitter.
[4] PEN	**Parity Enable** This bit enables or disables parity. Even or odd is determined by the PSEL bit. 0 = Parity is disabled. 1 = The transmitter sends data with an additional parity bit and the receiver receives an additional parity bit.
[3] PSEL	**Parity Select** 0 = Even parity is transmitted and expected on all received data. 1 = Odd parity is transmitted and expected on all received data.
[2] SBRK	**Send Break** This bit pauses or breaks data transmission. Sending a break interrupts any transmission in progress, so ensure that the transmitter has finished sending data before setting this bit. 0 = No break is sent. 1 = Forces a break condition by setting the output of the transmitter to zero.
[1] STOP	**Stop Bit Select** 0 = The transmitter sends one stop bit. 1 = The transmitter sends two stop bits.
[0] LBEN	**Loop Back Enable** 0 = Normal operation. 1 = All transmitted data is looped back to the receiver.

Table 67. UART Transmit Data Register (U0TXD)

Bit	7	6	5	4	3	2	1	0
Field	TXD							
RESET	X	X	X	X	X	X	X	X
R/W	W	W	W	W	W	W	W	W
Address	F40H							
Note: X = Undefined.								

Bit	Description
[7:0] TXD	**Transmit Data** UART transmitter data byte to be shifted out through the TXD*x* pin.

UART Receive Data Register

Data bytes received through the RXD*x* pin are stored in the UART Receive Data (UxRXD) Register, shown in Table 68. The read-only UART Receive Data Register shares a Register File address with the Write-only UART Transmit Data Register.

Table 68. UART Receive Data Register (U0RXD)

Bit	7	6	5	4	3	2	1	0
Field	RXD							
RESET	X	X	X	X	X	X	X	X
R/W	R	R	R	R	R	R	R	R
Address	F40H							
Note: X = Undefined.								

Bit	Description
[7:0] RXD	**Receive Data** UART receiver data byte from the RXD*x* pin.

UART Address Compare Register

The UART Address Compare (UxADDR) Register stores the multi-node network address of the UART (see Table 69). When the MPMD[1] bit of UART Control Register 0 is set, all incoming address bytes are compared to the value stored in the Address Compare Register. Receive interrupts and RDA assertions only occur in the event of a match.

The baud rate is set by the UART's Baud Rate Generator and supports IrDA standard baud rates from 9600 baud to 115.2 kbaud. Higher baud rates are possible, but do not meet IrDA specifications. The UART must be enabled to use the infrared endec. The infrared endec data rate is calculated using the following equation:

$$\text{Infrared Data Rate (bits/s)} = \frac{\text{System Clock Frequency (Hz)}}{16 \times \text{UART Baud Rate Divisor Value}}$$

Transmitting IrDA Data

The data to be transmitted using the infrared transceiver is first sent to the UART. The UART's transmit signal (TXD) and baud rate clock are used by the IrDA to generate the modulation signal (IR_TXD) that drives the infrared transceiver. Each UART/Infrared data bit is 16 clocks wide. If the data to be transmitted is 1, the IR_TXD signal remains low for the full 16 clock period. If the data to be transmitted is 0, the transmitter first outputs a 7 clock low period, followed by a 3 clock high pulse. Finally, a 6 clock low pulse is output to complete the full 16 clock data period. Figure 17 displays IrDA data transmission. When the infrared endec is enabled, the UART's TXD signal is internal to the Z8 Encore! XP F082A Series products while the IR_TXD signal is output through the TXD pin.

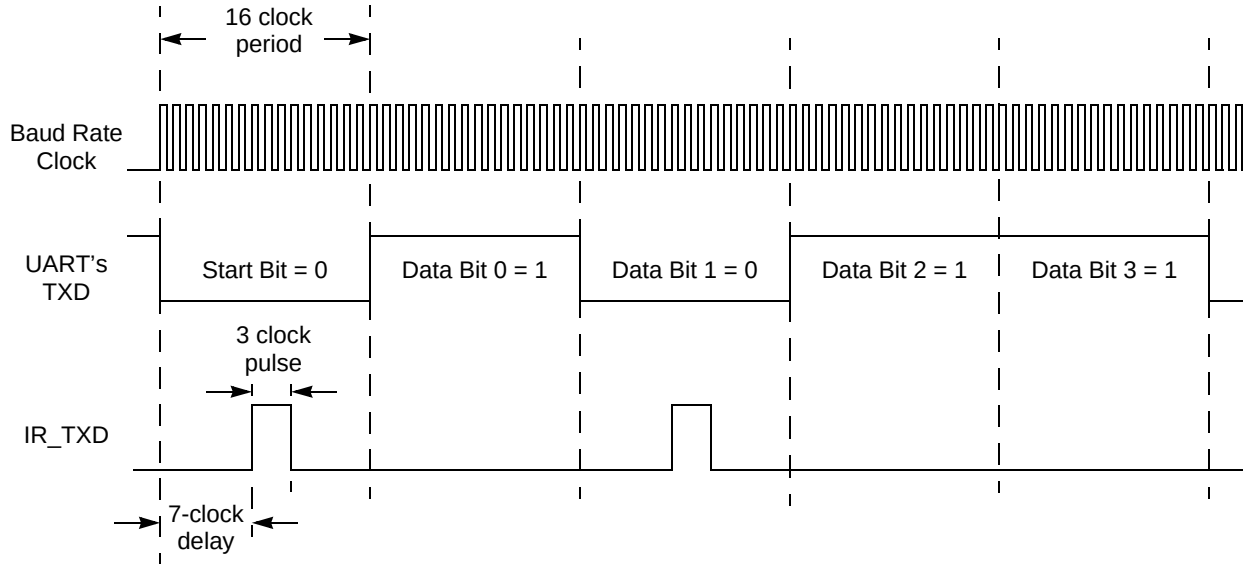

Figure 17. Infrared Data Transmission

Caution: The byte at each address of the Flash memory cannot be programmed (any bits written to 0) more than twice before an erase cycle occurs. Doing so may result in corrupted data at the target byte.

Page Erase

The Flash memory can be erased one page (512 bytes) at a time. Page Erasing the Flash memory sets all bytes in that page to the value FFH. The Flash Page Select Register identifies the page to be erased. Only a page residing in an unprotected sector can be erased. With the Flash Controller unlocked and the active page set, writing the value 95h to the Flash Control Register initiates the Page Erase operation. While the Flash Controller executes the Page Erase operation, the eZ8 CPU idles but the system clock and on-chip peripherals continue to operate. The eZ8 CPU resumes operation after the Page Erase operation completes. If the Page Erase operation is performed using the On-Chip Debugger, poll the Flash Status Register to determine when the Page Erase operation is complete. When the Page Erase is complete, the Flash Controller returns to its locked state.

Mass Erase

The Flash memory can also be Mass Erased using the Flash Controller, but only by using the On-Chip Debugger. Mass Erasing the Flash memory sets all bytes to the value FFH. With the Flash Controller unlocked and the Mass Erase successfully enabled, writing the value 63H to the Flash Control Register initiates the Mass Erase operation. While the Flash Controller executes the Mass Erase operation, the eZ8 CPU idles but the system clock and on-chip peripherals continue to operate. Using the On-Chip Debugger, poll the Flash Status Register to determine when the Mass Erase operation is complete. When the Mass Erase is complete, the Flash Controller returns to its locked state.

Flash Controller Bypass

The Flash Controller can be bypassed and the control signals for the Flash memory brought out to the GPIO pins. Bypassing the Flash Controller allows faster Row Programming algorithms by controlling the Flash programming signals directly.

Row programming is recommended for gang programming applications and large volume customers who do not require in-circuit initial programming of the Flash memory. Page Erase operations are also supported when the Flash Controller is bypassed.

For more information about bypassing the Flash Controller, refer to the Third-Party Flash Programming Support for Z8 Encore! MCUs Application Note (AN0117), which is available for download on www.zilog.com.

Randomized Lot Identifier

Table 104. Lot Identification Number (RAND_LOT)

Bit	7	6	5	4	3	2	1	0
Field	RAND_LOT							
RESET	U	U	U	U	U	U	U	U
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Address	Interspersed throughout Information Page Memory							

Note: U = Unchanged by Reset. R/W = Read/Write.

Bit	Description
[7] RAND_LOT	**Randomized Lot ID** The randomized lot ID is a 32-byte binary value that changes for each production lot. See Table 105.

Table 105. Randomized Lot ID Locations

Info Page Address	Memory Address	Usage
3C	FE3C	Randomized Lot ID Byte 31 (most significant).
3D	FE3D	Randomized Lot ID Byte 30.
3E	FE3E	Randomized Lot ID Byte 29.
3F	FE3F	Randomized Lot ID Byte 28.
58	FE58	Randomized Lot ID Byte 27.
59	FE59	Randomized Lot ID Byte 26.
5A	FE5A	Randomized Lot ID Byte 25.
5B	FE5B	Randomized Lot ID Byte 24.
5C	FE5C	Randomized Lot ID Byte 23.
5D	FE5D	Randomized Lot ID Byte 22.
5E	FE5E	Randomized Lot ID Byte 21.
5F	FE5F	Randomized Lot ID Byte 20.
61	FE61	Randomized Lot ID Byte 19.
62	FE62	Randomized Lot ID Byte 18.
64	FE64	Randomized Lot ID Byte 17.
65	FE65	Randomized Lot ID Byte 16.
67	FE67	Randomized Lot ID Byte 15.
68	FE68	Randomized Lot ID Byte 14.

```
DBG ← Size[15:8]
DBG ← Size[7:0]
DBG ← 1-65536 data bytes
```

Read Data Memory (0DH). The Read Data Memory command reads from Data Memory. This command is equivalent to the LDE and LDEI instructions. Data can be read 1 to 65536 bytes at a time (65536 bytes can be read by setting size to 0). If the device is not in DEBUG Mode, this command returns FFH for the data.

```
DBG ← 0DH
DBG ← Data Memory Address[15:8]
DBG ← Data Memory Address[7:0]
DBG ← Size[15:8]
DBG ← Size[7:0]
DBG → 1-65536 data bytes
```

Read Program Memory CRC (0EH). The Read Program Memory CRC command computes and returns the Cyclic Redundancy Check (CRC) of Program Memory using the 16-bit CRC-CCITT polynomial. If the device is not in DEBUG Mode, this command returns FFFFH for the CRC value. Unlike most other OCD Read commands, there is a delay from issuing of the command until the OCD returns the data. The OCD reads the Program Memory, calculates the CRC value and returns the result. The delay is a function of the Program Memory size and is approximately equal to the system clock period multiplied by the number of bytes in the Program Memory.

```
DBG ← 0EH
DBG → CRC[15:8]
DBG → CRC[7:0]
```

Step Instruction (10H). The Step Instruction command steps one assembly instruction at the current Program Counter (PC) location. If the device is not in DEBUG Mode or the Flash Read Protect Option bit is enabled, the OCD ignores this command.

```
DBG ← 10H
```

Stuff Instruction (11H). The Stuff Instruction command steps one assembly instruction and allows specification of the first byte of the instruction. The remaining 0-4 bytes of the instruction are read from Program Memory. This command is useful for stepping over instructions where the first byte of the instruction has been overwritten by a Breakpoint. If the device is not in DEBUG Mode or the Flash Read Protect Option bit is enabled, the OCD ignores this command.

```
DBG ← 11H
DBG ← opcode[7:0]
```

Execute Instruction (12H). The Execute Instruction command allows sending an entire instruction to be executed to the eZ8 CPU. This command can also step over Breakpoints. The number of bytes to send for the instruction depends on the opcode. If the device is not

Bit	Description (Continued)
[5] DBGACK	**Debug Acknowledge** This bit enables the debug acknowledge feature. If this bit is set to 1, the OCD sends a Debug Acknowledge character (FFH) to the host when a Breakpoint occurs. 0 = Debug Acknowledge is disabled. 1 = Debug Acknowledge is enabled.
[4:1]	**Reserved** These bits are reserved and must be programmed to 0000.
[0] RST	**Reset** Setting this bit to 1 resets the Z8F04xA family device. The device goes through a normal Power-On Reset sequence with the exception that the On-Chip Debugger is not reset. This bit is automatically cleared to 0 at the end of reset. 0 = No effect. 1 = Reset the Flash Read Protect Option Bit device.

OCD Status Register

The OCD Status Register reports status information about the current state of the debugger and the system.

Table 111. OCD Status Register (OCDSTAT)

Bit	7	6	5	4	3	2	1	0
Field	DBG	HALT	FRPENB	Reserved				
RESET	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R

Bit	Description
[7] DBG	**Debug Status** 0 = NORMAL Mode. 1 = DEBUG Mode.
[6] HALT	**HALT Mode** 0 = Not in HALT Mode. 1 = In HALT Mode.
[5] FRPENB	**Flash Read Protect Option Bit Enable** 0 = FRP bit enabled, that allows disabling of many OCD commands. 1 = FRP bit has no effect.
[4:0]	**Reserved** These bits are reserved and must be programmed to 00000.

Table 112. Oscillator Configuration and Selection

Clock Source	Characteristics	Required Setup
Internal Precision RC Oscillator	• 32.8kHz or 5.53MHz • High accuracy • No external components required	• Unlock and write Oscillator Control Register (OSCCTL) to enable and select oscillator at either 5.53MHz or 32.8kHz
External Crystal/ Resonator	• 32kHz to 20MHz • Very high accuracy (dependent on crystal or resonator used) • Requires external components	• Configure Flash option bits for correct external oscillator mode • Unlock and write OSCCTL to enable crystal oscillator, wait for it to stabilize and select as system clock (if the XTLDIS option bit has been deasserted, no waiting is required)
External RC Oscillator	• 32kHz to 4MHz • Accuracy dependent on external components	• Configure Flash option bits for correct external oscillator mode • Unlock and write OSCCTL to enable crystal oscillator and select as system clock
External Clock Drive	• 0 to 20MHz • Accuracy dependent on external clock source	• Write GPIO registers to configure PB3 pin for external clock function • Unlock and write OSCCTL to select external system clock • Apply external clock signal to GPIO
Internal Watchdog Timer Oscillator	• 10kHz nominal • Low accuracy; no external components required • Very low power consumption	• Enable WDT if not enabled and wait until WDT Oscillator is operating • Unlock and write Oscillator Control Register (OSCCTL) to enable and select oscillator

! **Caution:** Unintentional accesses to the Oscillator Control Register can actually stop the chip by switching to a nonfunctioning oscillator. To prevent this condition, the oscillator control block employs a register unlocking/locking scheme.

OSC Control Register Unlocking/Locking

To write the Oscillator Control Register, unlock it by making two writes to the OSCCTL Register with the values E7H followed by 18H. A third write to the OSCCTL Register changes the value of the actual register and returns the register to a locked state. Any other sequence of Oscillator Control Register writes has no effect. The values written to unlock the register must be ordered correctly, but are not necessarily consecutive. It is possible to write to or read from other registers within the unlocking/locking operation.

Table 118. Notational Shorthand (Continued)

Notation	Description	Operand	Range
Vector	Vector address	Vector	Vector represents a number in the range of 00H to FFH.
X	Indexed	#Index	The register or register pair to be indexed is offset by the signed Index value (#Index) in a +127 to –128 range.

Table 119 lists additional symbols that are used throughout the Instruction Summary and Instruction Set Description sections.

Table 119. Additional Symbols

Symbol	Definition
dst	Destination Operand
src	Source Operand
@	Indirect Address Prefix
SP	Stack Pointer
PC	Program Counter
FLAGS	Flags Register
RP	Register Pointer
#	Immediate Operand Prefix
B	Binary Number Suffix
%	Hexadecimal Number Prefix
H	Hexadecimal Number Suffix

Assignment of a value is indicated by an arrow, as shown in the following example.

dst ← dst + src

This example indicates that the source data is added to the destination data; the result is stored in the destination location.

eZ8 CPU Instruction Classes

eZ8 CPU instructions can be divided functionally into the following groups:

- Arithmetic
- Bit Manipulation

Table 132. Power Consumption (Continued)

		V_{DD} = 2.7 V to 3.6 V				
Symbol	**Parameter**	**Typical[1]**	**Maximum Std Temp[2]**	**Maximum Ext Temp[3]**	**Units**	**Conditions**
I_{DD} ADCRef	ADC Internal Reference Supply Current	0			µA	See Note 4.
I_{DD} CMP	Comparator supply Current	150	180	190	µA	See Note 4.
I_{DD} LPO	Low-Power Operational Amplifier Supply Current	3	5	5	µA	Driving a high-impedance load.
I_{DD} TS	Temperature Sensor Supply Current	60			µA	See Note 4.
I_{DD} BG	Band Gap Supply Current	320	480	500	µA	For 20-/28-pin devices.
						For 8-pin devices.

Notes:
1. Typical conditions are defined as V_{DD} = 3.3V and +30°C.
2. Standard temperature is defined as T_A = 0°C to +70°C; these values not tested in production for worst case behavior, but are derived from product characterization and provided for design guidance only.
3. Extended temperature is defined as T_A = –40°C to +105°C; these values not tested in production for worst case behavior, but are derived from product characterization and provided for design guidance only.
4. For this block to operate, the bandgap circuit is automatically turned on and must be added to the total supply current. This bandgap current is only added once, regardless of how many peripherals are using it.

On-Chip Peripheral AC and DC Electrical Characteristics

Table 135 tabulates the electrical characteristics of the POR and VBO blocks.

Table 135. Power-On Reset and Voltage Brown-Out Electrical Characteristics and Timing

		T_A = –40°C to +105°C				
Symbol	**Parameter**	**Minimum**	**Typical[1]**	**Maximum**	**Units**	**Conditions**
V_{POR}	Power-On Reset Voltage Threshold	2.20	2.45	2.70	V	$V_{DD} = V_{POR}$
V_{VBO}	Voltage Brown-Out Reset Voltage Threshold	2.15	2.40	2.65	V	$V_{DD} = V_{VBO}$
	V_{POR} to V_{VBO} hysteresis		50	75	mV	
	Starting V_{DD} voltage to ensure valid Power-On Reset.	–	V_{SS}	–	V	
T_{ANA}	Power-On Reset Analog Delay	–	70	–	µs	$V_{DD} > V_{POR}$; T_{POR} Digital Reset delay follows T_{ANA}
T_{POR}	Power-On Reset Digital Delay		16		µs	66 Internal Precision Oscillator cycles + IPO startup time (T_{IPOST})
T_{POR}	Power-On Reset Digital Delay		1		ms	5000 Internal Precision Oscillator cycles
T_{SMR}	Stop Mode Recovery with crystal oscillator disabled		16		µs	66 Internal Precision Oscillator cycles
T_{SMR}	Stop Mode Recovery with crystal oscillator enabled		1		ms	5000 Internal Precision Oscillator cycles
T_{VBO}	Voltage Brown-Out Pulse Rejection Period	–	10	–	µs	Period of time in which $V_{DD} < V_{VBO}$ without generating a Reset.

Note: Data in the typical column is from characterization at 3.3V and 30°C. These values are provided for design guidance only and are not tested in production.

Ordering Information

Order your F082A Series products from Zilog using the part numbers shown in Table 148. For more information about ordering, please consult your local Zilog sales office. The Sales Location page on the Zilog website lists all regional offices.

Table 148. Z8 Encore! XP F082A Series Ordering Matrix

Part Number	Flash	RAM	NVDS	I/O Lines	Interrupts	16-Bit Timers w/PWM	10-Bit A/D Channels	UART with IrDA	Comparator	Temperature Sensor	Description
Z8 Encore! XP F082A Series with 8KB Flash, 10-Bit Analog-to-Digital Converter
