
Welcome to E-XFL.COM

What is "Embedded - Microcontrollers"?

"Embedded - Microcontrollers" refer to small, integrated circuits designed to perform specific tasks within larger systems. These microcontrollers are essentially compact computers on a single chip, containing a processor core, memory, and programmable input/output peripherals. They are called "embedded" because they are embedded within electronic devices to control various functions, rather than serving as standalone computers. Microcontrollers are crucial in modern electronics, providing the intelligence and control needed for a wide range of applications.

Applications of "Embedded - Microcontrollers"

Details	
Product Status	Active
Core Processor	eZ8
Core Size	8-Bit
Speed	20MHz
Connectivity	IrDA, UART/USART
Peripherals	Brown-out Detect/Reset, LED, LVD, POR, PWM, Temp Sensor, WDT
Number of I/O	6
Program Memory Size	8KB (8K x 8)
Program Memory Type	FLASH
EEPROM Size	-
RAM Size	1K x 8
Voltage - Supply (Vcc/Vdd)	2.7V ~ 3.6V
Data Converters	A/D 4x10b
Oscillator Type	Internal
Operating Temperature	-40°C ~ 105°C (TA)
Mounting Type	Surface Mount
Package / Case	8-VDFN Exposed Pad
Supplier Device Package	8-QFN (5x6)
Purchase URL	https://www.e-xfl.com/product-detail/zilog/z8f082aqb020eg

Warning: DO NOT USE THIS PRODUCT IN LIFE SUPPORT SYSTEMS.

LIFE SUPPORT POLICY

ZILOG'S PRODUCTS ARE NOT AUTHORIZED FOR USE AS CRITICAL COMPONENTS IN LIFE SUPPORT DEVICES OR SYSTEMS WITHOUT THE EXPRESS PRIOR WRITTEN APPROVAL OF THE PRESIDENT AND GENERAL COUNSEL OF ZILOG CORPORATION.

As used herein

Life support devices or systems are devices which (a) are intended for surgical implant into the body, or (b) support or sustain life and whose failure to perform when properly used in accordance with instructions for use provided in the labeling can be reasonably expected to result in a significant injury to the user. A critical component is any component in a life support device or system whose failure to perform can be reasonably expected to cause the failure of the life support device or system or to affect its safety or effectiveness.

Document Disclaimer

 Information in this publication concerning the devices, applications, or technology described is intended to suggest possible uses and may be superseded. ZILOG, INC. DOES NOT ASSUME LIABILITY FOR OR PROVIDE A REPRESENTATION OF ACCURACY OF THE INFORMATION, DEVICES, OR TECHNOLOGY DESCRIBED IN THIS DOCUMENT. ZILOG ALSO DOES NOT ASSUME LIABILITY FOR INTELLECTUAL PROPERTY INFRINGEMENT RELATED IN ANY MANNER TO USE OF INFORMATION, DEVICES, OR TECHNOLOGY DESCRIBED HEREIN OR OTHERWISE. The information contained within this document has been verified according to the general principles of electrical and mechanical engineering.

Table 5. Z8 Encore! XP F082A Series Program Memory Maps (Continued)

Program Memory Address (Hex)	Function
0002–0003	Reset Vector
0004–0005	WDT Interrupt Vector
0006–0007	Illegal Instruction Trap
0008–0037	Interrupt Vectors*
0038–0039	Reserved
003A–003D	Oscillator Fail Trap Vectors
003E–03FF	Program Memory

Note: *See Table 32 on page 56 for a list of the interrupt vectors.

Data Memory

The Z8 Encore! XP F082A Series does not use the eZ8 CPU's 64 KB Data Memory address space.

Flash Information Area

Table 6 describes the Z8 Encore! XP F082A Series Flash Information Area. This 128B Information Area is accessed by setting bit 7 of the Flash Page Select Register to 1. When access is enabled, the Flash Information Area is mapped into the Program Memory and overlays the 128 bytes at addresses FE00H to FF7FH. When the Information Area access is enabled, all reads from these Program Memory addresses return the Information Area data rather than the Program Memory data. Access to the Flash Information Area is read-only.

Table 6. Z8 Encore! XP F082A Series Flash Memory Information Area Map

Program Memory Address (Hex)	Function
FE00–FE3F	Zilog Option Bits/Calibration Data
FE40–FE53	Part Number 20-character ASCII alphanumeric code Left-justified and filled with FFH
FE54–FE5F	Reserved
FE60–FE7F	Zilog Calibration Data
FE80–FFFF	Reserved

Reset, Stop Mode Recovery and Low Voltage Detection

The Reset Controller within the Z8 Encore! XP F082A Series controls Reset and Stop Mode Recovery operation and provides indication of low supply voltage conditions. In typical operation, the following events cause a Reset:

- Power-On Reset (POR)
- Voltage Brown-Out (VBO)
- Watchdog Timer time-out (when configured by the WDT_RES Flash option bit to initiate a reset)
- External $\overline{\text{RESET}}$ pin assertion (when the alternate RESET function is enabled by the GPIO Register)
- On-chip debugger initiated Reset (OCDCTL[0] set to 1)

When the device is in STOP Mode, a Stop Mode Recovery is initiated by either of the following occurrences:

- Watchdog Timer time-out
- GPIO Port input pin transition on an enabled Stop Mode Recovery source

The low voltage detection circuitry on the device (available on the 8-pin product versions only) performs the following functions:

- Generates the VBO reset when the supply voltage drops below a minimum safe level.
- Generates an interrupt when the supply voltage drops below a user-defined level (8-pin devices only).

Reset Types

The Z8 Encore! XP F082A Series provides several different types of Reset operation. Stop Mode Recovery is considered as a form of Reset. Table 8 lists the types of Reset and their operating characteristics. The System Reset is longer if the external crystal oscillator is enabled by the Flash option bits, allowing additional time for oscillator start-up.

Low-Power Modes

The Z8 Encore! XP F082A Series products contain power-saving features. The highest level of power reduction is provided by the STOP Mode, in which nearly all device functions are powered down. The next lower level of power reduction is provided by the HALT Mode, in which the CPU is powered down.

Further power savings can be implemented by disabling individual peripheral blocks while in Active mode (defined as being in neither STOP nor HALT Mode).

STOP Mode

Executing the eZ8 CPU's STOP instruction places the device into STOP Mode, powering down all peripherals except the Voltage Brown-Out detector, the Low-power Operational Amplifier and the Watchdog Timer. These three blocks may also be disabled for additional power savings. Specifically, the operating characteristics are:

- Primary crystal oscillator and internal precision oscillator are stopped; X_{IN} and X_{OUT} (if previously enabled) are disabled and PA0/PA1 revert to the states programmed by the GPIO registers
- System clock is stopped
- eZ8 CPU is stopped
- Program counter (PC) stops incrementing
- Watchdog Timer's internal RC oscillator continues to operate if enabled by the Oscillator Control Register
- If enabled, the Watchdog Timer logic continues to operate
- If enabled for operation in STOP Mode by the associated Flash option bit, the Voltage Brown-Out protection circuit continues to operate
- Low-power operational amplifier continues to operate if enabled by the Power Control Register
- All other on-chip peripherals are idle

To minimize current in STOP Mode, all GPIO pins that are configured as digital inputs must be driven to one of the supply rails (V_{CC} or GND). Additionally, any GPIOs configured as outputs must also be driven to one of the supply rails. The device can be brought out of STOP Mode using Stop Mode Recovery. For more information about Stop Mode Recovery, see the Reset, Stop Mode Recovery and Low Voltage Detection chapter on page 22.

HALT Mode

Executing the eZ8 CPU's HALT instruction places the device into HALT Mode, which powers down the CPU but leaves all other peripherals active. In HALT Mode, the operating characteristics are:

- Primary oscillator is enabled and continues to operate
- System clock is enabled and continues to operate
- eZ8 CPU is stopped
- Program counter (PC) stops incrementing
- Watchdog Timer's internal RC oscillator continues to operate
- If enabled, the Watchdog Timer continues to operate
- All other on-chip peripherals continue to operate, if enabled

The eZ8 CPU can be brought out of HALT Mode by any of the following operations:

- Interrupt
- Watchdog Timer time-out (interrupt or reset)
- Power-On Reset
- Voltage Brown-Out reset
- External $\overline{\text{RESET}}$ pin assertion

To minimize current in HALT Mode, all GPIO pins that are configured as inputs must be driven to one of the supply rails (V_{CC} or GND).

Peripheral-Level Power Control

In addition to the STOP and HALT modes, it is possible to disable each peripheral on each of the Z8 Encore! XP F082A Series devices. Disabling a given peripheral minimizes its power consumption.

Power Control Register Definitions

The following sections define the Power Control registers.

Power Control Register 0

Each bit of the following registers disables a peripheral block, either by gating its system clock input or by removing power from the block. The default state of the low-power

Port A–C Input Data Registers

Reading from the Port A–C Input Data registers, shown in Table 29, return the sampled values from the corresponding port pins. The Port A–C Input Data registers are read-only. The value returned for any unused ports is 0. Unused ports include those missing on the 8- and 28-pin packages, as well as those missing on the ADC-enabled 28-pin packages.

Table 29. Port A–C Input Data Registers (PxIN)

Bit	7	6	5	4	3	2	1	0
Field	PIN7	PIN6	PIN5	PIN4	PIN3	PIN2	PIN1	PIN0
RESET	X	X	X	X	X	X	X	X
R/W	R	R	R	R	R	R	R	R
Address	FD2H, FD6H, FDAH							

X = Undefined.

Bit	Description
[7:0] PxIN	**Port Input Data** Sampled data from the corresponding port pin input. 0 = Input data is logical 0 (Low). 1 = Input data is logical 1 (High).

Note: x indicates the specific GPIO port pin number (7–0).

Port A–D Output Data Register

The Port A–D Output Data Register, shown in Table 30, controls the output data to the pins.

Table 30. Port A–D Output Data Register (P*x*OUT)

Bit	7	6	5	4	3	2	1	0
Field	POUT7	POUT6	POUT5	POUT4	POUT3	POUT2	POUT1	POUT0
RESET	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Address	FD3H, FD7H, FDBH, FDFH							

Bit	Description
[7:0] PxOUT	**Port Output Data** These bits contain the data to be driven to the port pins. The values are only driven if the corresponding pin is configured as an output and the pin is not configured for alternate function operation. 0 = Drive a logical 0 (Low). 1 = Drive a logical 1 (High). High value is not driven if the drain has been disabled by setting the corresponding Port Output Control Register bit to 1.

Note: x indicates the specific GPIO port pin number (7–0).

Interrupt Request 2 Register

The Interrupt Request 2 (IRQ2) Register, shown in Table 37, stores interrupt requests for both vectored and polled interrupts. When a request is presented to the interrupt controller, the corresponding bit in the IRQ2 Register becomes 1. If interrupts are globally enabled (vectored interrupts), the interrupt controller passes an interrupt request to the eZ8 CPU. If interrupts are globally disabled (polled interrupts), the eZ8 CPU can read the Interrupt Request 2 Register to determine if any interrupt requests are pending.

Table 37. Interrupt Request 2 Register (IRQ2)

Bit	7	6	5	4	3	2	1	0
Field	Reserved				PC3I	PC2I	PC1I	PC0I
RESET	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Address	FC6H							

Bit	Description
[7:4]	**Reserved** These bits are reserved and must be programmed to 0000.
[3:0] PCxI	**Port C Pin *x* Interrupt Request** 0 = No interrupt request is pending for GPIO Port C pin *x*. 1 = An interrupt request from GPIO Port C pin *x* is awaiting service.

Note: x indicates the specific GPIO Port C pin number (0–3).

IRQ0 Enable High and Low Bit Registers

Table 38 describes the priority control for IRQ0. The IRQ0 Enable High and Low Bit registers, shown in Tables 39 and 40, form a priority-encoded enabling for interrupts in the Interrupt Request 0 Register.

Table 38. IRQ0 Enable and Priority Encoding

IRQ0ENH[*x*]	IRQ0ENL[*x*]	Priority	Description
0	0	Disabled	Disabled
0	1	Level 1	Low
1	0	Level 2	Medium
1	1	Level 3	High

Note: x indicates register bits 0–7.

Table 46. IRQ2 Enable Low Bit Register (IRQ2ENL)

Bit	7	6	5	4	3	2	1	0
Field	Reserved				C3ENL	C2ENL	C1ENL	C0ENL
RESET	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Address	FC8H							

Bit	Description
[7:4]	**Reserved** These bits are reserved and must be programmed to 0000.
[3] C3ENL	**Port C3 Interrupt Request Enable Low Bit**
[2] C2ENL	**Port C2 Interrupt Request Enable Low Bit**
[1] C1ENL	**Port C1 Interrupt Request Enable Low Bit**
[0] C0ENL	**Port C0 Interrupt Request Enable Low Bit**

Interrupt Edge Select Register

The Interrupt Edge Select (IRQES) Register, shown in Table 47, determines whether an interrupt is generated for the rising edge or falling edge on the selected GPIO Port A input pin.

Table 47. Interrupt Edge Select Register (IRQES)

Bit	7	6	5	4	3	2	1	0
Field	IES7	IES6	IES5	IES4	IES3	IES2	IES1	IES0
RESET	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Address	FCDH							

Bit	Description
[7:0] IESx	**Interrupt Edge Select *x*** 0 = An interrupt request is generated on the falling edge of the PA*x* input. 1 = An interrupt request is generated on the rising edge of the PA*x* input.

Note: x indicates the specific GPIO port pin number (0–7).

it is appropriate to have the Timer Output make a state change at a One-Shot time-out (rather than a single cycle pulse), first set the TPOL bit in the Timer Control Register to the start value before enabling ONE-SHOT Mode. After starting the timer, set TPOL to the opposite bit value.

Observe the following steps for configuring a timer for ONE-SHOT Mode and initiating the count:

1. Write to the Timer Control Register to:
   - Disable the timer
   - Configure the timer for ONE-SHOT Mode.
   - Set the prescale value.
   - Set the initial output level (High or Low) if using the Timer Output alternate function.
2. Write to the Timer High and Low Byte registers to set the starting count value.
3. Write to the Timer Reload High and Low Byte registers to set the reload value.
4. If appropriate, enable the timer interrupt and set the timer interrupt priority by writing to the relevant interrupt registers.
5. If using the Timer Output function, configure the associated GPIO port pin for the Timer Output alternate function.
6. Write to the Timer Control Register to enable the timer and initiate counting.

In ONE-SHOT Mode, the system clock always provides the timer input. The timer period is computed via the following equation:

$$\text{ONE-SHOT Mode Time-Out Period (s)} = \frac{\text{Reload Value} - \text{Start Value} \times \text{Prescale}}{\text{System Clock Frequency (Hz)}}$$

CONTINUOUS Mode

In CONTINUOUS Mode, the timer counts up to the 16-bit reload value stored in the Timer Reload High and Low Byte registers. The timer input is the system clock. Upon reaching the reload value, the timer generates an interrupt, the count value in the Timer High and Low Byte registers is reset to 0001H and counting resumes. Also, if the Timer Output alternate function is enabled, the Timer Output pin changes state (from Low to High or from High to Low) at timer Reload.

Observe the following steps for configuring a timer for CONTINUOUS Mode and initiating the count:

1. Write to the Timer Control Register to:
   - Disable the timer
   - Configure the timer for CONTINUOUS Mode

– Set the Capture edge (rising or falling) for the Timer Input

2. Write to the Timer High and Low Byte registers to set the starting count value (typically 0001H).
3. Write to the Timer Reload High and Low Byte registers to set the Compare value.
4. Enable the timer interrupt, if appropriate and set the timer interrupt priority by writing to the relevant interrupt registers.By default, the timer interrupt are generated for both input capture and reload events. If appropriate, configure the timer interrupt to be generated only at the input capture event or the reload event by setting TICONFIG field of the TxCTL0 Register.
5. Configure the associated GPIO port pin for the Timer Input alternate function.
6. Write to the Timer Control Register to enable the timer.
7. Counting begins on the first appropriate transition of the Timer Input signal. No interrupt is generated by this first edge.

In CAPTURE/COMPARE Mode, the elapsed time from timer start to Capture event can be calculated using the following equation:

$$\text{Capture Elapsed Time (s)} = \frac{(\text{Capture Value} - \text{Start Value}) \times \text{Prescale}}{\text{System Clock Frequency (Hz)}}$$

Reading the Timer Count Values

The current count value in the timers can be read while counting (enabled). This capability has no effect on timer operation. When the timer is enabled and the Timer High Byte Register is read, the contents of the Timer Low Byte Register are placed in a holding register. A subsequent read from the Timer Low Byte Register returns the value in the holding register. This operation allows accurate reads of the full 16-bit timer count value while enabled. When the timers are not enabled, a read from the Timer Low Byte Register returns the actual value in the counter.

Timer Pin Signal Operation

The timer output function is a GPIO port pin alternate function. The Timer Output is toggled every time the counter is reloaded.

Watchdog Timer Calibration Data

Table 100. Watchdog Calibration High Byte at 007EH (WDTCALH)

Bit	7	6	5	4	3	2	1	0
Field	WDTCALH							
RESET	U	U	U	U	U	U	U	U
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Address	Information Page Memory 007EH							

Note: U = Unchanged by Reset. R/W = Read/Write.

Bit	Description
[7:0] WDTCALH	**Watchdog Timer Calibration High Byte** The WDTCALH and WDTCALL bytes, when loaded into the Watchdog Timer reload registers result in a one second time-out at room temperature and 3.3V supply voltage. To use the Watchdog Timer calibration, user code must load WDTU with 0x00, WDTH with WDTCALH and WDTL with WDTCALL.

Operation

This section describes the interface and modes of operation of the On-Chip Debugger.

OCD Interface

The on-chip debugger uses the DBG pin for communication with an external host. This one-pin interface is a bidirectional, open-drain interface that transmits and receives data. Data transmission is half-duplex, in that transmit and receive cannot occur simultaneously. The serial data on the DBG pin is sent using the standard asynchronous data format defined in RS-232. This pin creates an interface from the Z8 Encore! XP F082A Series products to the serial port of a host PC using minimal external hardware.Two different methods for connecting the DBG pin to an RS-232 interface are displayed in Figure 24 and Figure 25. The recommended method is the buffered implementation displayed in Figure 25. The DBG pin has a internal pull-up resistor which is sufficient for some applications (for more details about the pull-up current, see the Electrical Characteristics chapter on page 226). For OCD operation at higher data rates or in noisy systems, an external pull-up resistor is recommended.

! Caution: For operation of the on-chip debugger, all power pins (V_{DD} and AV_{DD}) must be supplied with power and all ground pins (V_{SS} and AV_{SS}) must be properly grounded. The DBG pin is open-drain and may require an external pull-up resistor to ensure proper operation.

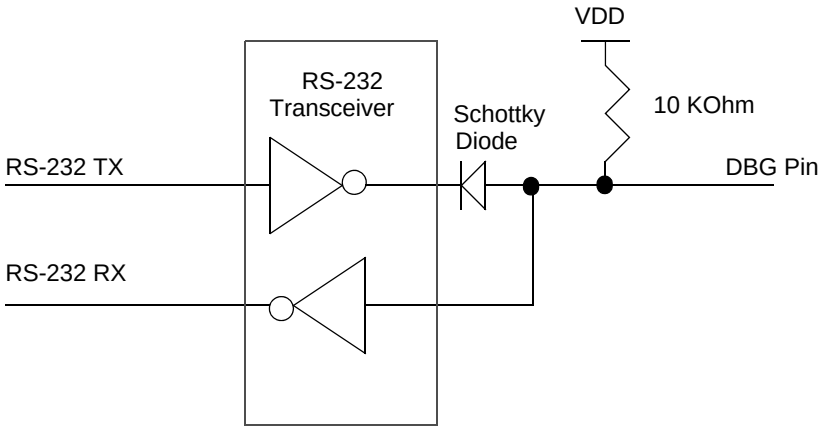

Figure 24. Interfacing the On-Chip Debugger's DBG Pin with an RS-232 Interface; #1 of 2

```
DBG ← Size[15:8]
DBG ← Size[7:0]
DBG ← 1-65536 data bytes
```

Read Data Memory (0DH). The Read Data Memory command reads from Data Memory. This command is equivalent to the LDE and LDEI instructions. Data can be read 1 to 65536 bytes at a time (65536 bytes can be read by setting size to 0). If the device is not in DEBUG Mode, this command returns FFH for the data.

```
DBG ← 0DH
DBG ← Data Memory Address[15:8]
DBG ← Data Memory Address[7:0]
DBG ← Size[15:8]
DBG ← Size[7:0]
DBG → 1-65536 data bytes
```

Read Program Memory CRC (0EH). The Read Program Memory CRC command computes and returns the Cyclic Redundancy Check (CRC) of Program Memory using the 16-bit CRC-CCITT polynomial. If the device is not in DEBUG Mode, this command returns FFFFH for the CRC value. Unlike most other OCD Read commands, there is a delay from issuing of the command until the OCD returns the data. The OCD reads the Program Memory, calculates the CRC value and returns the result. The delay is a function of the Program Memory size and is approximately equal to the system clock period multiplied by the number of bytes in the Program Memory.

```
DBG ← 0EH
DBG → CRC[15:8]
DBG → CRC[7:0]
```

Step Instruction (10H). The Step Instruction command steps one assembly instruction at the current Program Counter (PC) location. If the device is not in DEBUG Mode or the Flash Read Protect Option bit is enabled, the OCD ignores this command.

```
DBG ← 10H
```

Stuff Instruction (11H). The Stuff Instruction command steps one assembly instruction and allows specification of the first byte of the instruction. The remaining 0-4 bytes of the instruction are read from Program Memory. This command is useful for stepping over instructions where the first byte of the instruction has been overwritten by a Breakpoint. If the device is not in DEBUG Mode or the Flash Read Protect Option bit is enabled, the OCD ignores this command.

```
DBG ← 11H
DBG ← opcode[7:0]
```

Execute Instruction (12H). The Execute Instruction command allows sending an entire instruction to be executed to the eZ8 CPU. This command can also step over Breakpoints. The number of bytes to send for the instruction depends on the opcode. If the device is not

Table 130. Absolute Maximum Ratings (Continued)

Parameter	Minimum	Maximum	Units	Notes
Maximum current into V_{DD} or out of V_{SS}		120	mA	
28-pin Packages Maximum Ratings at 0°C to 70°C				
Total power dissipation		450	mW	
Maximum current into V_{DD} or out of V_{SS}		125	mA	

Notes: Operating temperature is specified in DC Characteristics.
1. This voltage applies to all pins except the following: V_{DD}, AV_{DD}, pins supporting analog input (Port B[5:0], Port C[2:0]) and pins supporting the crystal oscillator (PA0 and PA1). On the 8-pin packages, this applies to all pins but V_{DD}.
2. This voltage applies to pins on the 20-/28-pin packages supporting analog input (Port B[5:0], Port C[2:0]) and pins supporting the crystal oscillator (PA0 and PA1).

DC Characteristics

Table 131 lists the DC characteristics of the Z8 Encore! XP F082A Series products. All voltages are referenced to V_{SS}, the primary system ground.

Table 131. DC Characteristics

		T_A = –40°C to +105°C (unless otherwise specified)				
Symbol	**Parameter**	**Minimum**	**Typical**	**Maximum**	**Units**	**Conditions**
V_{DD}	Supply Voltage	2.7	–	3.6	V	
V_{IL1}	Low Level Input Voltage	–0.3	–	$0.3*V_{DD}$	V	
V_{IH1}	High Level Input Voltage	$0.7*V_{DD}$	–	5.5	V	For all input pins without analog or oscillator function. For all signal pins on the 8-pin devices. Programmable pull-ups must also be disabled.
V_{IH2}	High Level Input Voltage	$0.7*V_{DD}$	–	$V_{DD}+0.3$	V	For those pins with analog or oscillator function (20-/28-pin devices only), or when programmable pull-ups are enabled.
V_{OL1}	Low Level Output Voltage	–	–	0.4	V	I_{OL} = 2 mA; V_{DD} = 3.0 V High Output Drive disabled.

Notes:
1. This condition excludes all pins that have on-chip pull-ups, when driven Low.
2. These values are provided for design guidance only and are not tested in production.

Table 131. DC Characteristics (Continued)

		T_A = –40°C to +105°C (unless otherwise specified)				
Symbol	**Parameter**	**Minimum**	**Typical**	**Maximum**	**Units**	**Conditions**
V_{OH1}	High Level Output Voltage	2.4	–	–	V	I_{OH} = -2 mA; V_{DD} = 3.0 V High Output Drive disabled.
V_{OL2}	Low Level Output Voltage	–	–	0.6	V	I_{OL} = 20 mA; V_{DD} = 3.3V High Output Drive enabled.
V_{OH2}	High Level Output Voltage	2.4	–	–	V	I_{OH} = -20 mA; V_{DD} = 3.3V High Output Drive enabled.
I_{IH}	Input Leakage Current	–	±0.002	±5	µA	V_{IN} = V_{DD} V_{DD} = 3.3V;
I_{IL}	Input Leakage Current	–	±0.007	±5	µA	V_{IN} = V_{SS} V_{DD} = 3.3V;
I_{TL}	Tristate Leakage Current	–	–	±5	µA	
I_{LED}	Controlled Current Drive	1.8	3	4.5	mA	{AFS2,AFS1} = {0,0}
		2.8	7	10.5	mA	{AFS2,AFS1} = {0,1}
		7.8	13	19.5	mA	{AFS2,AFS1} = {1,0}
		12	20	30	mA	{AFS2,AFS1} = {1,1}
C_{PAD}	GPIO Port Pad Capacitance	–	8.0[2]	–	pF	
C_{XIN}	XIN Pad Capacitance	–	8.0[2]	–	pF	
C_{XOUT}	X_{OUT} Pad Capacitance	–	9.5[2]	–	pF	
I_{PU}	Weak Pull-up Current	30	100	350	µA	V_{DD} = 3.0 V–3.6 V
V_{RAM}	RAM Data Retention Voltage	TBD			V	Voltage at which RAM retains static values; no reading or writing is allowed.

Notes:
1. This condition excludes all pins that have on-chip pull-ups, when driven Low.
2. These values are provided for design guidance only and are not tested in production.

Table 139. Analog-to-Digital Converter Electrical Characteristics and Timing (Continued)

		V_{DD} = 3.0 V to 3.6 V T_A = 0°C to +70°C (unless otherwise stated)				
Symbol	**Parameter**	**Minimum**	**Typical**	**Maximum**	**Units**	**Conditions**
	Continuous Conversion Time	–	256	–	System clock cycles	All measurements but temperature sensor
			512			Temperature sensor measurement
	Signal Input Bandwidth	–	10		kHz	As defined by -3 dB point
R_S	Analog Source Impedance[4]	–	–	10	kΩ	In unbuffered mode
				500	kΩ	In buffered modes
Zin	Input Impedance	–	150		kΩ	In unbuffered mode at 20MHz[5]
		10	–		MΩ	In buffered modes
Vin	Input Voltage Range	0		V_{DD}	V	Unbuffered Mode
		0.3		V_{DD}–1.1	V	Buffered Modes These values define the range over which the ADC performs within spec; exceeding these values does not cause damage or instability; see DC Characteristics for absolute pin voltage limits.

Notes:
1. Analog source impedance affects the ADC offset voltage (because of pin leakage) and input settling time.
2. Devices are factory calibrated at V_{DD} = 3.3V and T_A = +30°C, so the ADC is maximally accurate under these conditions.
3. LSBs are defined assuming 10-bit resolution.
4. This is the maximum recommended resistance seen by the ADC input pin.
5. The input impedance is inversely proportional to the system clock frequency.

Packaging

Zilog's Product Line of MCUs includes the Z8F011A, Z8F012A, Z8F021A, Z8F022A, Z8F041A, Z8F042A, Z8F081A and Z8F082A devices, which are available in the following packages:

- 8-pin Plastic Dual-Inline Package (PDIP)
- 8-Pin Quad Flat No-Lead Package (QFN)/MLF-S[1]
- 8-pin Small Outline Integrated Circuit Package (SOIC)
- 20-pin Small Outline Integrated Circuit Package (SOIC)
- 20-pin Small Shrink Outline Package (SSOP)
- 20-pin Plastic Dual-Inline Package (PDIP)
- 28-pin Small Outline Integrated Circuit Package (SOIC)
- 28-pin Small Shrink Outline Package (SSOP)
- 28-pin Plastic Dual-Inline Package (PDIP)

Current diagrams for each of these packages are published in Zilog's Packaging Product Specification (PS0072), which is available free for download from the Zilog website.

1. The footprint of the QFN)/MLF-S package is identical to that of the 8-pin SOIC package, but with a lower profile.

Part Number Suffix Designations

Zilog part numbers consist of a number of components, as indicated in the following example.

Example. Part number Z8F042ASH020SG is an 8-bit Flash MCU with 4KB of Program Memory, equipped with advanced analog peripherals in a 20-pin SOIC package, operating within a 0ºC to +70ºC temperature range and built using lead-free solder.
