## Understanding [Embedded - FPGAs \(Field Programmable Gate Array\)](#)

Embedded - FPGAs, or Field Programmable Gate Arrays, are advanced integrated circuits that offer unparalleled flexibility and performance for digital systems. Unlike traditional fixed-function logic devices, FPGAs can be programmed and reprogrammed to execute a wide array of logical operations, enabling customized functionality tailored to specific applications. This reprogrammability allows developers to iterate designs quickly and implement complex functions without the need for custom hardware.

## Applications of Embedded - FPGAs

The versatility of Embedded - FPGAs makes them indispensable in numerous fields. In telecommunications.

### Details

|                                |                                                                                                                                                                         |
|--------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------|

**Figure 2-4. Slice Diagram**

For Slices 0 and 2, memory control signals are generated from Slice 1 as follows:

WCK is CLK  
WRE is from LSR  
DI[3:2] for Slice 2 and DI[1:0] for Slice 0 data  
WAD [A:D] is a 4bit address from slice 1 LUT input

**Table 2-2. Slice Signal Descriptions**

| Function | Type               | Signal Names   | Description                                                          |
|----------|--------------------|----------------|----------------------------------------------------------------------|
| Input    | Data signal        | A0, B0, C0, D0 | Inputs to LUT4                                                       |
| Input    | Data signal        | A1, B1, C1, D1 | Inputs to LUT4                                                       |
| Input    | Multi-purpose      | M0             | Multipurpose Input                                                   |
| Input    | Multi-purpose      | M1             | Multipurpose Input                                                   |
| Input    | Control signal     | CE             | Clock Enable                                                         |
| Input    | Control signal     | LSR            | Local Set/Reset                                                      |
| Input    | Control signal     | CLK            | System Clock                                                         |
| Input    | Inter-PFU signal   | FC             | Fast Carry-in <sup>1</sup>                                           |
| Input    | Inter-slice signal | FXA            | Intermediate signal to generate LUT6 and LUT7                        |
| Input    | Inter-slice signal | FXB            | Intermediate signal to generate LUT6 and LUT7                        |
| Output   | Data signals       | F0, F1         | LUT4 output register bypass signals                                  |
| Output   | Data signals       | Q0, Q1         | Register outputs                                                     |
| Output   | Data signals       | OFX0           | Output of a LUT5 MUX                                                 |
| Output   | Data signals       | OFX1           | Output of a LUT6, LUT7, LUT8 <sup>2</sup> MUX depending on the slice |
| Output   | Inter-PFU signal   | FCO            | Slice 2 of each PFU is the fast carry chain output <sup>1</sup>      |

1. See Figure 2-4 for connection details.

2. Requires two PFUs.

this special vertical routing channel and the eight secondary clock regions for the ECP2-50. LatticeECP2 devices have four secondary clocks (SC0 to SC3) which are distributed to every region.

The secondary clock muxes are located in the center of the device. Figure 2-16 shows the mux structure of the secondary clock routing. Secondary clocks SC0 to SC3 are used for clock and control and SC4 to SC7 are used for high fan-out signals.

**Figure 2-15. Secondary Clock Regions ECP2-50**

2. Write Through – A copy of the input data appears at the output of the same port during a write cycle. This mode is supported for all data widths.

## Memory Core Reset

The memory array in the EBR utilizes latches at the A and B output ports. These latches can be reset asynchronously or synchronously. RSTA and RSTB are local signals, which reset the output latches associated with Port A and Port B, respectively. The Global Reset (GSRN) signal resets both ports. The output data latches and associated resets for both ports are as shown in Figure 2-20.

**Figure 2-20. Memory Core Reset**

For further information about the sysMEM EBR block, please see the the list of additional technical documentation at the end of this data sheet.

## EBR Asynchronous Reset

EBR asynchronous reset or GSR (if used) can only be applied if all clock enables are low for a clock cycle before the reset is applied and released a clock cycle after the reset is released, as shown in Figure 2-21. The GSR input to the EBR is always asynchronous.

**Figure 2-21. EBR Asynchronous Reset (Including GSR) Timing Diagram**

If all clock enables remain enabled, the EBR asynchronous reset or GSR may only be applied and released after the EBR read and write clock inputs are in a steady state condition for a minimum of  $1/f_{MAX}$  (EBR clock). The reset release must adhere to the EBR synchronous reset setup time before the next active read or write clock edge.

|                                 | Reset Signal Pulse Width (RST)        | Without external capacitor               | 500   | —    | —     | ns    |
|                                 |                                       | With external capacitor <sup>5</sup>     | 20    | —    | —     | μs    |

1. Jitter sample is taken over 10,000 samples of the primary PLL output with clean reference clock and no additional I/O pins toggling.

2. Output clock is valid after  $t_{LOCK}$  for PLL reset and dynamic delay adjustment.

3. Using LVDS output buffers.

4. Phase accuracy of CLKOS compared to CLKOP.

5. Value of external capacitor: 5.6 nF ±20%, NPO dielectric, ceramic chip capacitor, 1206 or smaller package, connected to PLLCAP pin.

6.  $f_{OUT}(\text{max}) = f_{IN} * 10$  for  $f_{IN} < 5$  MHz.

### SERDES External Reference Clock (LatticeECP2M Family Only)

The external reference clock selection and its interface are a critical part of system applications for this product. Table 3-14 specifies reference clock requirements, over the full range of operating conditions.

**Table 3-14. External Reference Clock Specification (refclkp/refclkn)**

| Symbol                   | Description                                       | Min. | Typ.  | Max.                   | Units   |
|--------------------------|---------------------------------------------------|------|-------|------------------------|---------|
| F <sub>REF</sub>         | Frequency range                                   | 25   | —     | 320                    | MHz     |
| F <sub>REF-PPM</sub>     | Frequency tolerance                               | -300 | —     | 300                    | ppm     |
| V <sub>REF-IN-SE</sub>   | Input swing, single-ended clock <sup>1</sup>      | 100  | —     | 1200                   | mV, p-p |
| V <sub>REF-IN</sub>      | Input levels                                      | 0    | —     | V <sub>CCP</sub> + 0.8 | V       |
| V <sub>REF-CM-DC</sub>   | Input common mode range (DC coupled)              | 0.5  | —     | 1.2                    | V       |
| V <sub>REF-CM-AC</sub>   | Input common mode range (AC coupled) <sup>2</sup> | 0    | —     | 1.5                    | V       |
| D <sub>REF</sub>         | Duty cycle <sup>3</sup>                           | 40   | —     | 60                     | %       |
| T <sub>REF-R</sub>       | Rise time (20% to 80%)                            |      | 500   | 1000                   | ps      |
| T <sub>REF-F</sub>       | Fall time (80% to 20%)                            |      | 500   | 1000                   | ps      |
| Z <sub>REF-IN-TERM</sub> | Input termination                                 |      | 50/2K |                        | Ohms    |
| C <sub>REF-IN-CAP</sub>  | Input capacitance <sup>4</sup>                    | —    | —     | 1.5                    | pF      |

1. The signal swing for a single-ended input clock must be as large as the p-p differential swing of a differential input clock to get the same gain at the input receiver. Lower swings for the clock may be possible, but will tend to increase jitter.
2. When AC coupled, the input common mode range is determined by:  

$$(\text{Min input level}) + (\text{Peak-to-peak input swing})/2 \leq (\text{Input common mode voltage}) \leq (\text{Max input level}) - (\text{Peak-to-peak input swing})/2$$
3. Measured at 50% amplitude.
4. Input capacitance of 1.5pF is total capacitance, including both device and package.

**Figure 3-13. Jitter Transfer**

Note: This graph is for a nominal device.

### SERDES Power-Down/Power-Up Specification

**Table 3-15. Power-Down and Power-Up Specification**

| Symbol             | Description                                                   | Max. | Units |
|--------------------|---------------------------------------------------------------|------|-------|
| t <sub>PWRDN</sub> | Power-down time after all power down register bits set to '0' | 10   | μs    |
| t <sub>PWRUP</sub> | Power-up time after all power down register bits set to '1'   | 100  | μs    |

\* Supports true LVDS. Other differential signals must be emulated with external resistors.

\*\* These dedicated input pins can be used for GPLLs or GDLLs within the respective quadrant.

\*\*\*Due to packaging bond out option, this DQS does not have all the necessary DQ pins bonded out for a full 8-bit data width.

Note: VCCIO and GND pads are used to determine the average DC current drawn by I/Os between GND/VCCIO connections, or between the last GND/VCCIO in an I/O bank and the end of an I/O bank. The substrate pads listed in the Pin Table do not necessarily have a one to one connection with a package ball or pin.
