

Welcome to [E-XFL.COM](https://www.e-xfl.com)

Understanding **Embedded - FPGAs (Field Programmable Gate Array)**

Embedded - FPGAs, or Field Programmable Gate Arrays, are advanced integrated circuits that offer unparalleled flexibility and performance for digital systems. Unlike traditional fixed-function logic devices, FPGAs can be programmed and reprogrammed to execute a wide array of logical operations, enabling customized functionality tailored to specific applications. This reprogrammability allows developers to iterate designs quickly and implement complex functions without the need for custom hardware.

Applications of Embedded - FPGAs

The versatility of Embedded - FPGAs makes them indispensable in numerous fields. In telecommunications,

Details

Product Status	Obsolete
Number of LABs/CLBs	2625
Number of Logic Elements/Cells	21000
Total RAM Bits	282624
Number of I/O	131
Number of Gates	-
Voltage - Supply	1.14V ~ 1.26V
Mounting Type	Surface Mount
Operating Temperature	0°C ~ 85°C (TJ)
Package / Case	208-BFQFP
Supplier Device Package	208-PQFP (28x28)
Purchase URL	https://www.e-xfl.com/product-detail/lattice-semiconductor/lfe2-20e-6q208c

Features

- **High Logic Density for System Integration**
 - 6K to 95K LUTs
 - 90 to 583 I/Os
- **Embedded SERDES (LatticeECP2M Only)**
 - Data Rates 250 Mbps to 3.125 Gbps
 - Up to 16 channels per device
PCI Express, Ethernet (1GbE, SGMII), OBSAI, CPRI and Serial RapidIO.
- **sysDSP™ Block**
 - 3 to 42 blocks for high performance multiply and accumulate
 - Each block supports
 - One 36x36, four 18x18 or eight 9x9 multipliers
- **Flexible Memory Resources**
 - 55Kbits to 5308Kbits sysMEM™ Embedded Block RAM (EBR)
 - 18Kbit block
 - Single, pseudo dual and true dual port
 - Byte Enable Mode support
 - 12K to 202Kbits distributed RAM
 - Single port and pseudo dual port
- **sysCLOCK Analog PLLs and DLLs**
 - Two GPLLs and up to six SPLLs per device
 - Clock multiply, divide, phase & delay adjust
 - Dynamic PLL adjustment
 - Two general purpose DLLs per device
- **Pre-Engineered Source Synchronous I/O**
 - DDR registers in I/O cells
 - Dedicated gearing logic
 - Source synchronous standards support
 - SPI4.2, SF14 (DDR Mode), XGMII
 - High Speed ADC/DAC devices
 - Dedicated DDR and DDR2 memory support
 - DDR1: 400 (200MHz) / DDR2: 533 (266MHz)
 - Dedicated DQS support
- **Programmable sysI/O™ Buffer Supports Wide Range Of Interfaces**
 - LVTTTL and LVCMOS 33/25/18/15/12
 - SSTL 3/2/18 I, II
 - HSTL15 I and HSTL18 I, II
 - PCI and Differential HSTL, SSTL
 - LVDS, RSDS, Bus-LVDS, MLVDS, LVPECL
- **Flexible Device Configuration**
 - 1149.1 Boundary Scan compliant
 - Dedicated bank for configuration I/Os
 - SPI boot flash interface
 - Dual boot images supported
 - TransFR™ I/O for simple field updates
 - Soft Error Detect macro embedded
- **Optional Bitstream Encryption (LatticeECP2/M “S” Versions Only)**
- **System Level Support**
 - ispTRACY™ internal logic analyzer capability
 - On-chip oscillator for initialization & general use
 - 1.2V power supply

Table 1-1. LatticeECP2 (Including “S-Series”) Family Selection

Device	ECP2-6	ECP2-12	ECP2-20	ECP2-35	ECP2-50	ECP2-70

Architecture Overview

Each LatticeECP2/M device contains an array of logic blocks surrounded by Programmable I/O Cells (PIC). Interspersed between the rows of logic blocks are rows of sysMEM™ Embedded Block RAM (EBR) and rows of sys-DSP™ Digital Signal Processing blocks, as shown in Figure 2-1. In addition, the LatticeECP2M family contains SERDES Quads in one or more of the corners. Figure 2-2 shows the block diagram of ECP2M20 with one quad.

There are two kinds of logic blocks, the Programmable Functional Unit (PFU) and Programmable Functional Unit without RAM (PFF). The PFU contains the building blocks for logic, arithmetic, RAM and ROM functions. The PFF block contains building blocks for logic, arithmetic and ROM functions. Both PFU and PFF blocks are optimized for flexibility, allowing complex designs to be implemented quickly and efficiently. Logic Blocks are arranged in a two-dimensional array. Only one type of block is used per row.

The LatticeECP2/M devices contain one or more rows of sysMEM EBR blocks. sysMEM EBRs are large dedicated 18K fast memory blocks. Each sysMEM block can be configured in a variety of depths and widths of RAM or ROM. In addition, LatticeECP2/M devices contain up to two rows of DSP Blocks. Each DSP block has multipliers and adder/accumulators, which are the building blocks for complex signal processing capabilities.

The LatticeECP2M devices feature up to 16 embedded 3.125Gbps SERDES (Serializer / Deserializer) channels. Each SERDES channel contains independent 8b/10b encoding / decoding, polarity adjust and elastic buffer logic. Each group of four SERDES channels along with its Physical Coding Sub-layer (PCS) block, creates a quad. The functionality of the SERDES/PCS Quads can be controlled by memory cells set during device configuration or by registers that are addressable during device operation. The registers in every quad can be programmed by a soft IP interface, referred to as the SERDES Client Interface (SCI). These quads (up to four) are located at the corners of the devices.

Each PIC block encompasses two PIOs (PIO pairs) with their respective sysI/O buffers. The sysI/O buffers of the LatticeECP2/M devices are arranged in eight banks, allowing the implementation of a wide variety of I/O standards. In addition, a separate I/O bank is provided for the programming interfaces. PIO pairs on the left and right edges of the device can be configured as LVDS transmit/receive pairs. The PIC logic also includes pre-engineered support to aid in the implementation of high speed source synchronous standards such as SPI4.2, along with memory interfaces including DDR2.

The LatticeECP2/M registers in PFU and sysI/O can be configured to be SET or RESET. After power up and the device is configured, it enters into user mode with these registers SET/RESET according to the configuration setting, allowing the device entering to a known state for predictable system function.

Other blocks provided include PLLs, DLLs and configuration functions. The LatticeECP2/M architecture provides two General PLLs (GPLL) and up to six Standard PLLs (SPLL) per device. In addition, each LatticeECP2/M family member provides two DLLs per device. The GPLLs and DLLs blocks are located in pairs at the end of the bottom-most EBR row; the DLL block is located towards the edge of the device. The SPLL blocks are located at the end of the other EBR/DSP rows.

The configuration block that supports features such as configuration bit-stream decryption, transparent updates and dual boot support is located toward the center of this EBR row. The Ball Grid Array (BGA) package devices in the LatticeECP2/M family supports a sysCONFIG™ port located in the corner between banks four and five, which allows for serial or parallel device configuration.

In addition, every device in the family has a JTAG port. This family also provides an on-chip oscillator. The LatticeECP2/M devices use 1.2V as their core voltage.

sysMEM Memory

LatticeECP2/M devices contains a number of sysMEM Embedded Block RAM (EBR). The EBR consists of an 18-Kbit RAM with dedicated input and output registers.

sysMEM Memory Block

The sysMEM block can implement single port, dual port or pseudo dual port memories. Each block can be used in a variety of depths and widths as shown in Table 2-6. FIFOs can be implemented in sysMEM EBR blocks by implementing support logic with PFUs. The EBR block facilitates parity checking by supporting an optional parity bit for each data byte. EBR blocks provide byte-enable support for configurations with 18-bit and 36-bit data widths.

Table 2-6. sysMEM Block Configurations

Memory Mode	Configurations
Single Port	16,384 x 1
	8,192 x 2
	4,096 x 4
	2,048 x 9
	1,024 x 18
True Dual Port	512 x 36
	16,384 x 1
	8,192 x 2
	4,096 x 4
	2,048 x 9
Pseudo Dual Port	1,024 x 18
	16,384 x 1
	8,192 x 2
	4,096 x 4
	2,048 x 9
	1,024 x 18
	512 x 36

Bus Size Matching

All of the multi-port memory modes support different widths on each of the ports. The RAM bits are mapped LSB word 0 to MSB word 0, LSB word 1 to MSB word 1, and so on. Although the word size and number of words for each port varies, this mapping scheme applies to each port.

RAM Initialization and ROM Operation

If desired, the contents of the RAM can be pre-loaded during device configuration. By preloading the RAM block during the chip configuration cycle and disabling the write controls, the sysMEM block can also be utilized as a ROM.

Memory Cascading

Larger and deeper blocks of RAM can be created using EBR sysMEM Blocks. Typically, the Lattice design tools cascade memory transparently, based on specific design inputs.

Single, Dual and Pseudo-Dual Port Modes

In all the sysMEM RAM modes the input data and address for the ports are registered at the input of the memory array. The output data of the memory is optionally registered at the output.

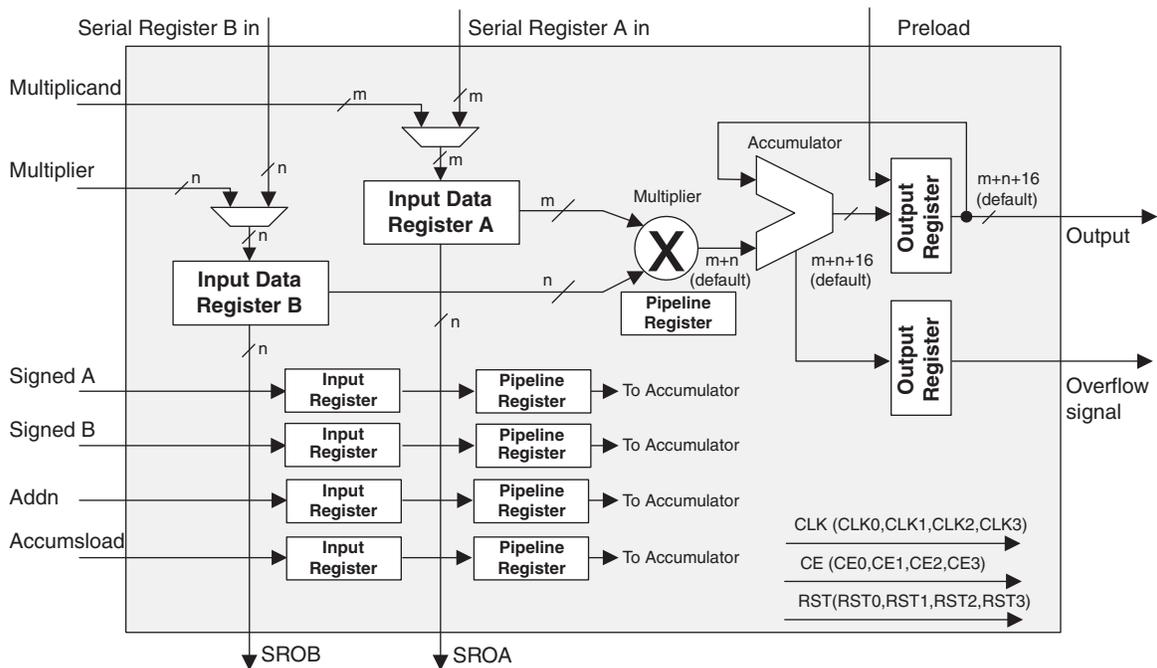

EBR memory supports two forms of write behavior for single port or dual port operation:

1. Normal – Data on the output appears only during a read cycle. During a write cycle, the data (at the current address) does not appear on the output. This mode is supported for all data widths.

MAC sysDSP Element

In this case, the two operands, A and B, are multiplied and the result is added with the previous accumulated value. This accumulated value is available at the output. The user can enable the input and pipeline registers, but the output register is always enabled. The output register is used to store the accumulated value. The Accumulators in the DSP blocks in the LatticeECP2/M family can be initialized dynamically. A registered overflow signal is also available. The overflow conditions are provided later in this document. Figure 2-24 shows the MAC sysDSP element.

Figure 2-24. MAC sysDSP

Signal Descriptions (Cont.)

Signal Name	I/O	Description
[LOC]_SQ_VCCIBm	—	Input buffer power supply, channel m (1.2V/1.5V). This pin should be left floating if the channel is unused.
[LOC]_SQ_VCCOBm	—	Output buffer power supply, channel m (1.2V/1.5V). This pin should be left floating if the channel is unused.
[LOC]_SQ_HDOUINm	O	High-speed output, negative channel m
[LOC]_SQ_HDOUOPm	O	High-speed output, positive channel m
[LOC]_SQ_HDINNm	I	High-speed input, negative channel m
[LOC]_SQ_HDINPm	I	High-speed input, positive channel m
[LOC]_SQ_VCCTXm ⁴	—	Transmitter power supply, channel m (1.2V). This pin must be tied to 1.2V even if the channel is unused.
[LOC]_SQ_VCCR Xm ⁴	—	Receiver power supply, channel m (1.2V). This pin must be tied to 1.2V even if the channel is unused.

1. These signals are relevant for LatticeECP2M family.
2. m defines the associated channel in the Quad.
3. These signals are defined in Quads [LOC] indicates the corner SERDES Quad is located: ULC (upper left), URC (upper right), LLC (lower left), LRC (lower right).
4. When placing switching I/Os around these critical pins that are designed to supply the device with the proper reference or supply voltage, care must be given. For more information, refer to TN1159, [LatticeECP2/M Pin Assignment Recommendations](#).
5. There may be SPLs that do not have dedicated I/Os.

Date	Version	Section	Change Summary
June 2013 (cont.)	04.0 (cont.)	DC and Switching Characteristics	sysCLOCK SPLL Timing table – Corrected signal names for t_{RST} parameter.
			LatticeECP2/M sysCONFIG Port Timing Specifications table – added t_{SUMCDI} and t_{HMCDI} parameters.
September 2013	04.1	Architecture	Updated Selectable Master Clock (CCLK) Frequencies during Configuration table.
		DC and Switching Characteristics	Added information on f_{MAXSPI} parameter in LatticeECP2/M sysCONFIG Port Timing Specifications table.
