Welcome to E-XFL.COM

Understanding Embedded - FPGAs (Field Programmable Gate Array)

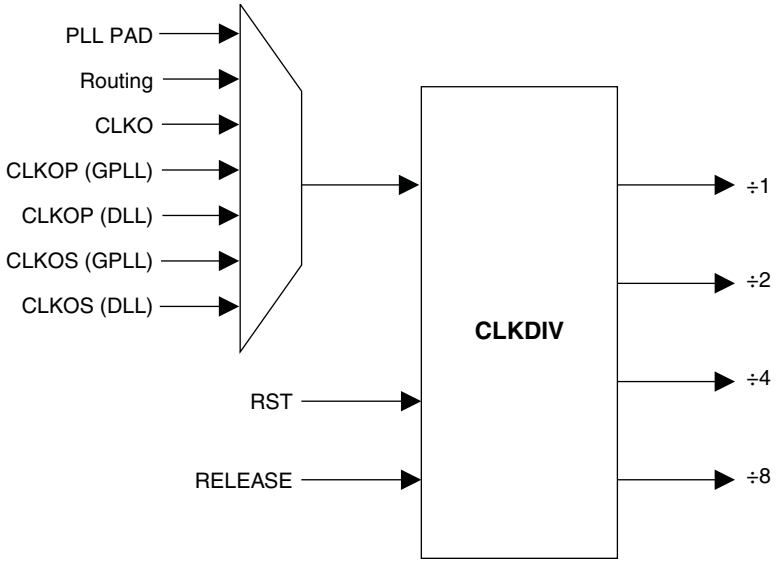
Embedded - FPGAs, or Field Programmable Gate Arrays, are advanced integrated circuits that offer unparalleled flexibility and performance for digital systems. Unlike traditional fixed-function logic devices, FPGAs can be programmed and reprogrammed to execute a wide array of logical operations, enabling customized functionality tailored to specific applications. This reprogrammability allows developers to iterate designs quickly and implement complex functions without the need for custom hardware.

Applications of Embedded - FPGAs

The versatility of Embedded - FPGAs makes them indispensable in numerous fields. In telecommunications.

Details	
Product Status	Active
Number of LABs/CLBs	2625
Number of Logic Elements/Cells	21000
Total RAM Bits	282624
Number of I/O	193
Number of Gates	-
Voltage - Supply	1.14V ~ 1.26V
Mounting Type	Surface Mount
Operating Temperature	-40°C ~ 100°C (TJ)
Package / Case	256-BGA
Supplier Device Package	256-FPBGA (17x17)
Purchase URL	https://www.e-xfl.com/product-detail/lattice-semiconductor/lfe2-20se-5fn256i

Figure 2-9. Clock Divider Connections



Clock Distribution Network

LatticeECP2/M devices have eight quadrant-based primary clocks and eight flexible region-based secondary clocks/control signals. Two high performance edge clocks are available on each edge of the device to support high speed interfaces. These clock inputs are selected from external I/Os, the sysCLOCK PLLs, DLLs or routing. These clock inputs are fed throughout the chip via a clock distribution system.

Primary Clock Sources

LatticeECP2/M devices derive clocks from five primary sources: PLL (GPLL and SPLL) outputs, DLL outputs, CLKDIV outputs, dedicated clock inputs and routing. LatticeECP2/M devices have two to eight sysCLOCK PLLs and two DLLs, located on the left and right sides of the device. There are eight dedicated clock inputs, two on each side of the device, with the exception of the LatticeECP2M 256-fpBGA package devices which have six dedicated clock inputs on the device. Figure 2-10 shows the primary clock sources.

sysMEM Memory

LatticeECP2/M devices contains a number of sysMEM Embedded Block RAM (EBR). The EBR consists of an 18-Kbit RAM with dedicated input and output registers.

sysMEM Memory Block

The sysMEM block can implement single port, dual port or pseudo dual port memories. Each block can be used in a variety of depths and widths as shown in Table 2-6. FIFOs can be implemented in sysMEM EBR blocks by implementing support logic with PFUs. The EBR block facilitates parity checking by supporting an optional parity bit for each data byte. EBR blocks provide byte-enable support for configurations with18-bit and 36-bit data widths.

Table 2-6. sysMEM Block Configurations

Memory Mode	Configurations
Single Port	16,384 x 1 8,192 x 2 4,096 x 4 2,048 x 9 1,024 x 18 512 x 36
True Dual Port	16,384 x 1 8,192 x 2 4,096 x 4 2,048 x 9 1,024 x 18
Pseudo Dual Port	16,384 x 1 8,192 x 2 4,096 x 4 2,048 x 9 1,024 x 18 512 x 36

Bus Size Matching

All of the multi-port memory modes support different widths on each of the ports. The RAM bits are mapped LSB word 0 to MSB word 0, LSB word 1 to MSB word 1, and so on. Although the word size and number of words for each port varies, this mapping scheme applies to each port.

RAM Initialization and ROM Operation

If desired, the contents of the RAM can be pre-loaded during device configuration. By preloading the RAM block during the chip configuration cycle and disabling the write controls, the sysMEM block can also be utilized as a ROM.

Memory Cascading

Larger and deeper blocks of RAM can be created using EBR sysMEM Blocks. Typically, the Lattice design tools cascade memory transparently, based on specific design inputs.

Single, Dual and Pseudo-Dual Port Modes

In all the sysMEM RAM modes the input data and address for the ports are registered at the input of the memory array. The output data of the memory is optionally registered at the output.

EBR memory supports two forms of write behavior for single port or dual port operation:

1. Normal – Data on the output appears only during a read cycle. During a write cycle, the data (at the current address) does not appear on the output. This mode is supported for all data widths.

- MULT (Multiply)
- MAC (Multiply, Accumulate)
- MULTADDSUB (Multiply, Addition/Subtraction)
- MULTADDSUBSUM (Multiply, Addition/Subtraction, Accumulate)

The number of elements available on each block depends in the width selected from the three available options x9, x18, and x36. A number of these elements are concatenated for highly parallel implementations of DSP functions. Table 2-7 shows the capabilities of the block.

Table 2-7. Maximum Number of Elements in a Block

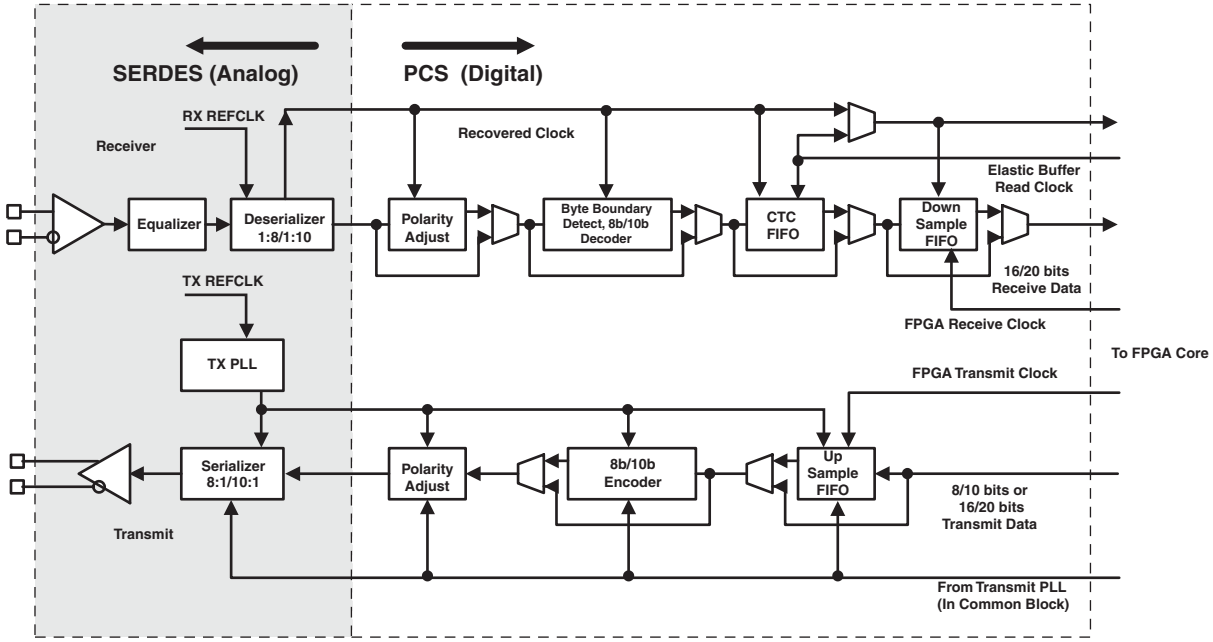
Width of Multiply	x9	x18	x36
MULT	8	4	1
MAC	2	2	—
MULTADDSUB	4	2	—
MULTADDSUBSUM	2	1	—

Some options are available in four elements. The input register in all the elements can be directly loaded or can be loaded as a shift register from previous operand registers. By selecting “dynamic operation” the following operations are possible:

- In the ‘Signed/Unsigned’ options the operands can be switched between signed and unsigned on every cycle.
- In the ‘Add/Sub’ option the Accumulator can be switched between addition and subtraction on every cycle.
- The loading of operands can switch between parallel and serial operations.

Each Transmit and Receive channel has its independent power supplies. The Output and Input buffers of each channel also have their own independent power supplies. In addition, there are separate power supplies for PLL, terminating resistor per quad.

Figure 2-40. Simplified Channel Block Diagram for SERDES and PCS



PCS

As shown in Figure 2-40, the PCS receives the parallel digital data from the deserializer receivers and adjusts the polarity, detects, byte boundary, decodes (8b/10b) and provides Clock Tolerance Compensation (CTC) FIFO for changing the clock domain from receiver clock to the FPGA Clock.

For the transmit channel, the PCS block receives the parallel data from the FPGA core, encodes it with 8b/10b, adjusts the polarity and passes the 8/10 bit data to the transmit SERDES channel.

The PCS also provides bypass modes that allow a direct 8-bit or 10-bit interface from the SERDES to the FPGA logic. The PCS interface to FPGA can also be programmed to run at 1/2 speed for a 16-bit or 20-bit interface to the FPGA logic.

SCI (SERDES Client Interface) Bus

The SERDES Client Interface (SCI) is a soft IP interface that allow the SERDES/PCS Quad block to be controlled by registers as opposed to the configuration memory cells. It is a simple register configuration interface.

The Diamond design tools support all modes of the PCS. Most modes are dedicated to applications associated with a specific industry standard data protocol. Other more general purpose modes allow users to define their own operation. With Diamond, the user can define the mode for each quad in a design.

Popular standards such as 10Gb Ethernet and x4 PCI-Express and 4x Serial RapidIO can be implemented using IP (provided by Lattice), a single quad (Four SERDES channels and PCS) and some additional logic from the core.

For further information about SERDES, please see the list of additional technical documentation at the end of this data sheet.

Typical Building Block Function Performance[1]

Pin-to-Pin Performance (LVCMOS25 12mA Drive)

Function	-7 Timing	Units
Basic Functions		
16-bit Decoder	3.8	ns
32-bit Decoder	4.5	ns
64-bit Decoder	5.0	ns
4:1 MUX	3.2	ns
8:1 MUX	3.4	ns
16:1 MUX	3.5	ns
32:1 MUX	4.0	ns

1. These timing numbers were generated using the ispLEVER 8.0 design tool. Exact performance may vary with device and tool version. The tool uses internal parameters that have been characterized but are not tested on every device.

Register-to-Register Performance

Function	-7 Timing	Units
Basic Functions		
16-bit Decoder	599	MHz
32-bit Decoder	542	MHz
64-bit Decoder	417	MHz
4:1 MUX	847	MHz
8:1 MUX	803	MHz
16:1 MUX	660	MHz
32:1 MUX	577	MHz
8-bit Adder	591	MHz
16-bit Adder	500	MHz
64-bit Adder	306	MHz
16-bit Counter	488	MHz
32-bit Counter	378	MHz
64-bit Counter	260	MHz
64-bit Accumulator	253	MHz
Embedded Memory Functions		
512x36 Single Port RAM, EBR Output Registers	370	MHz
1024x18 True-Dual Port RAM (Write Through or Normal, EBR Output Registers)	370	MHz
1024x18 True-Dual Port RAM (Write Through or Normal, PLC Output Registers)	280	MHz
Distributed Memory Functions		
16x4 Pseudo-Dual Port RAM (One PFU)	819	MHz
32x4 Pseudo-Dual Port RAM	521	MHz
64x8 Pseudo-Dual Port RAM	435	MHz
DSP Functions		
18x18 Multiplier (All Registers)	420	MHz
9x9 Multiplier (All Registers)	420	MHz

Table 3-13. Periodic Receiver Jitter Tolerance Specification[1]

Description	Frequency	Condition	Min.	Typ.	Max.	Units
Periodic	3.125 Gbps	600 mV differential eye	—	—	0.20	UI, p-p
	2.5 Gbps	600 mV differential eye	—	—	0.22	UI, p-p
	1.25 Gbps	600 mV differential eye	—	—	0.20	UI, p-p
	250 Mbps[2]	600 mV differential eye	—	—	0.08	UI, p-p

1. Values are measured with PRBS 2^7-1, all channels operating.
2. Jitter specification is limited by measurement equipment capability.

SERDES External Reference Clock (LatticeECP2M Family Only)

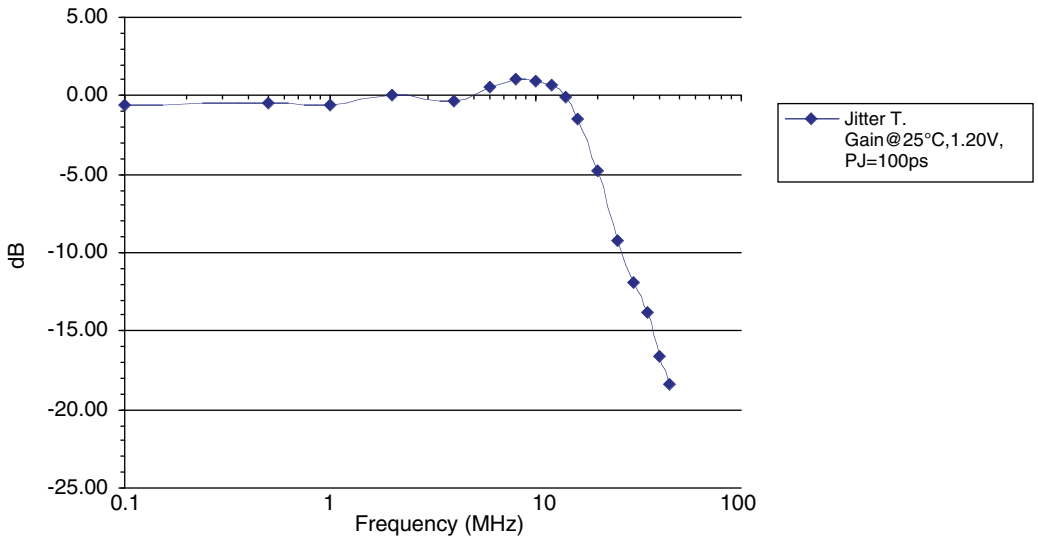
The external reference clock selection and its interface are a critical part of system applications for this product. Table 3-14 specifies reference clock requirements, over the full range of operating conditions.

Table 3-14. External Reference Clock Specification (refclkp/refclkn)

Symbol	Description	Min.	Typ.	Max.	Units
F_{REF}	Frequency range	25	—	320	MHz
$F_{REF-PPM}$	Frequency tolerance	-300	—	300	ppm
$V_{REF-IN-SE}$	Input swing, single-ended clock[1]	100	—	1200	mV, p-p
V_{REF-IN}	Input levels	0	—	V_{CCP} + 0.8	V
$V_{REF-CM-DC}$	Input common mode range (DC coupled)	0.5	—	1.2	V
$V_{REF-CM-AC}$	Input common mode range (AC coupled)[2]	0	—	1.5	V
D_{REF}	Duty cycle[3]	40	—	60	%
T_{REF-R}	Rise time (20% to 80%)		500	1000	ps
T_{REF-F}	Fall time (80% to 20%)		500	1000	ps
$Z_{REF-IN-TERM}$	Input termination		50/2K		Ohms
$C_{REF-IN-CAP}$	Input capacitance[4]	—	—	1.5	pF

1. The signal swing for a single-ended input clock must be as large as the p-p differential swing of a differential input clock to get the same gain at the input receiver. Lower swings for the clock may be possible, but will tend to increase jitter.
2. When AC coupled, the input common mode range is determined by:
(Min input level) + (Peak-to-peak input swing)/2 ≤ (Input common mode voltage) ≤ (Max input level) - (Peak-to-peak input swing)/2
3. Measured at 50% amplitude.
4. Input capacitance of 1.5pF is total capacitance, including both device and package.

Figure 3-13. Jitter Transfer



Note: This graph is for a nominal device.

SERDES Power-Down/Power-Up Specification

Table 3-15. Power-Down and Power-Up Specification

Symbol	Description	Max.	Units
t_{PWRDN}	Power-down time after all power down register bits set to '0'	10	µs
t_{PWRUP}	Power-up time after all power down register bits set to '1'	100	µs
