Understanding [Embedded - FPGAs \(Field Programmable Gate Array\)](#)

Embedded - FPGAs, or Field Programmable Gate Arrays, are advanced integrated circuits that offer unparalleled flexibility and performance for digital systems. Unlike traditional fixed-function logic devices, FPGAs can be programmed and reprogrammed to execute a wide array of logical operations, enabling customized functionality tailored to specific applications. This reprogrammability allows developers to iterate designs quickly and implement complex functions without the need for custom hardware.

Applications of Embedded - FPGAs

The versatility of Embedded - FPGAs makes them indispensable in numerous fields. In telecommunications,

Polarity Control Logic

In a typical DDR Memory interface design, the phase relationship between the incoming delayed DQS strobe and the internal system clock (during the READ cycle) is unknown.

The LatticeECP2/M family contains dedicated circuits to transfer data between these domains. To prevent set-up and hold violations, at the domain transfer between DQS (delayed) and the system clock, a clock polarity selector is used. This changes the edge on which the data is registered in the synchronizing registers in the input register block. This requires evaluation at the start of each READ cycle for the correct clock polarity.

Prior to the READ operation in DDR memories, DQS is in tristate (pulled by termination). The DDR memory device drives DQS low at the start of the preamble state. A dedicated circuit detects the first DQS rising edge after the preamble state. This signal is used to control the polarity of the clock to the synchronizing registers.

Symbol	Parameter	Min.	Max.	Units
V_{CCP}^6	PLL and Reference Clock Buffer Power	1.14	1.26	V

1. If V_{CCIO} or V_{CCJ} is set to 1.2V, they must be connected to the same power supply as V_{CC} . If V_{CCIO} or V_{CCJ} is set to 3.3V, they must be connected to the same power supply as V_{CCAUX} . V_{CCPLL} must be connected to the same power supply as V_{CC} through careful filtering and decoupling.
2. See recommended voltages by I/O standard in subsequent table.
3. V_{CCAUX} ramp rate must not exceed 30mV/ μ s during power-up when transitioning between 0V and 3.3V.
4. For proper power-up configuration, users must ensure that the configuration control signals such as the CFGx, INITN, PROGRAMN and DONE pins are driven to the proper logic levels when the device powers up. The device power-up is triggered by the last of V_{CC} , V_{CCAUX} or V_{CCIO8} supplies that reaches its minimum valid levels. Alternatively, if the configuration control signals are pulled up by V_{CCIO8} , the V_{CCIO8} (configuration I/O bank) voltage must be powered up prior to or at the same time as the last of V_{CC} or V_{CCAUX} reaches its minimum levels.
5. For power-up, V_{CC} must reach its valid minimum value before powering up V_{CCAUX} (LatticeECP2/M "S" version devices only).
6. V_{CCRX} , V_{CCTX} and V_{CCP} must be tied together in each quad and all quads need to be powered up.
7. For more power supply design recommendations, refer to TN1114 [Electrical Recommendations for Lattice SERDES](#).

Hot Socketing Specifications^{1, 2, 3, 4}

1. V_{CC} , V_{CCAUX} and V_{CCIO} should rise/fall monotonically. V_{CC} and V_{CCPLL} must be connected to the same power supply (applies to ECP2-6, ECP2-12 and ECP2-20 only).
2. $0 \leq V_{CC} \leq V_{CC} (MAX)$, $0 \leq V_{CCIO} \leq V_{CCIO} (MAX)$ or $0 \leq V_{CCAUX} \leq V_{CCAUX} (MAX)$.
3. I_{DK} is additive to I_{PU} , I_{PW} or I_{BH} .
4. LVCMOS and LVTTL only.
5. Assumes that the device is powered down with all supplies grounded, both P and N inputs driven by a CML driver with maximum allowed V_{CCIB} of 1.575V, 8b10b data and internal AC coupling.

ESD Performance

Please refer to [LatticeECP2/M Product Family Qualification Summary](#) for complete qualification data, including ESD performance.

LVPECL

The LatticeECP2/M devices support the differential LVPECL standard. This standard is emulated using complementary LVCMOS outputs in conjunction with a parallel resistor across the driver outputs. The LVPECL input standard is supported by the LVDS differential input buffer. The scheme shown in Figure 3-3 is one possible solution for point-to-point signals.
