## Understanding [Embedded - FPGAs \(Field Programmable Gate Array\)](#)

Embedded - FPGAs, or Field Programmable Gate Arrays, are advanced integrated circuits that offer unparalleled flexibility and performance for digital systems. Unlike traditional fixed-function logic devices, FPGAs can be programmed and reprogrammed to execute a wide array of logical operations, enabling customized functionality tailored to specific applications. This reprogrammability allows developers to iterate designs quickly and implement complex functions without the need for custom hardware.

## Applications of Embedded - FPGAs

The versatility of Embedded - FPGAs makes them indispensable in numerous fields. In telecommunications,

### Details

Product Status	Not For New Designs
Number of LABs/CLBs	11875
Number of Logic Elements/Cells	95000
Total RAM Bits	5435392
Number of I/O	520
Number of Gates	-
Voltage - Supply	1.14V ~ 1.26V
Mounting Type	Surface Mount
Operating Temperature	-40°C ~ 100°C (TJ)
Package / Case	1152-BBGA
Supplier Device Package	1152-FPBGA (35x35)
Purchase URL	<a href="https://www.e-xfl.com/product-detail/lattice-semiconductor/lfe2m100e-5fn1152i">https://www.e-xfl.com/product-detail/lattice-semiconductor/lfe2m100e-5fn1152i</a>

## ROM Mode

ROM mode uses the LUT logic; hence, Slices 0 through 3 can be used in ROM mode. Preloading is accomplished through the programming interface during PFU configuration.

## Routing

There are many resources provided in the LatticeECP2/M devices to route signals individually or as buses with related control signals. The routing resources consist of switching circuitry, buffers and metal interconnect (routing) segments.

The inter-PFU connections are made with x1 (spans two PFU), x2 (spans three PFU) and x6 (spans seven PFU). The x1 and x2 connections provide fast and efficient connections in horizontal and vertical directions. The x2 and x6 resources are buffered, allowing the routing of both short and long connections between PFUs.

The LatticeECP2/M family has an enhanced routing architecture that produces a compact design. The Diamond design software takes the output of the synthesis tool and places and routes the design. Generally, the place and route tool is completely automatic, although an interactive routing editor is available to optimize the design.

## sysCLOCK Phase Locked Loops (GPLL/SPLL)

The sysCLOCK PLLs provide the ability to synthesize clock frequencies. All the devices in the LatticeECP2/M family support two General Purpose PLLs (GPLLs) which are full-featured PLLs. In addition, some of the larger devices have two to six Standard PLLs (SPLLs) that have a subset of GPLL functionality.

### General Purpose PLL (GPLL)

The architecture of the GPLL is shown in Figure 2-5. A description of the GPLL functionality follows.

CLKI is the reference frequency (generated either from the pin or from routing) for the PLL. CLKI feeds into the Input Clock Divider block. The CLKFB is the feedback signal (generated from CLKOP or from a user clock PIN/ logic). This signal feeds into the Feedback Divider. The Feedback Divider is used to multiply the reference frequency.

The Delay Adjust Block adjusts either the delays of the reference or feedback signals. The Delay Adjust Block can either be programmed during configuration or can be adjusted dynamically. The setup, hold or clock-to-out times of the device can be improved by programming a delay in the feedback or input path of the PLL, which will advance or delay the output clock with reference to the input clock.

Following the Delay Adjust Block, both the input path and feedback signals enter the Voltage Controlled Oscillator (VCO) block. In this block the difference between the input path and feedback signals is used to control the frequency and phase of the oscillator. A LOCK signal is generated by the VCO to indicate that the VCO has locked onto the input clock signal. In dynamic mode, the PLL may lose lock after a dynamic delay adjustment and not relock until the  $t_{LOCK}$  parameter has been satisfied. LatticeECP2/M devices have two dedicated pins on the left and right edges of the device for connecting optional external capacitors to the VCO. This allows the PLLs to operate at a lower frequency. This is a shared resource that can only be used by one PLL (GPLL or SPLL) per side.

The output of the VCO then enters the post-scalar divider. The post-scalar divider allows the VCO to operate at higher frequencies than the clock output (CLKOP), thereby increasing the frequency range. A secondary divider takes the CLKOP signal and uses it to derive lower frequency outputs (CLKOK). The Phase/Duty Select block adjusts the phase and duty cycle of the CLKOP signal and generates the CLKOS signal. The phase/duty cycle setting can be pre-programmed or dynamically adjusted.

The primary output from the post scalar divider CLKOP along with the outputs from the secondary divider (CLKOK) and Phase/Duty select (CLKOS) are fed to the clock distribution network.

The DLLs in the LatticeECP2/M are used to shift the clock in relation to the data for source synchronous inputs. PLLs are used for frequency synthesis and clock generation for source synchronous interfaces. Cascading PLL and DLL blocks allows applications to utilize the unique benefits of both DLLs and PLLs.

For further information about the DLL, please see the list of additional technical documentation at the end of this data sheet.

## **GPLL/SPLL/GDLL PIO Input Pin Connections (LatticeECP2M Family Only)**

All LatticeECP2M devices contain two GDLLs, two GPLPs and six SPLLs, arranged in quadrants as shown in Figure 2-8. In the LatticeECP2M devices GPLPs, SPLLs and GDLLs share their input pins. Figure 2-8 shows the sharing of SPLLs input pin connections in the upper two quadrants and the sharing of GDLL, GPLP and SPLL input pin connections in the lower two quadrants.

**Figure 2-8. Sharing of PIO Pins by GPLP, SPLL and GDLL in LatticeECP2M Devices**

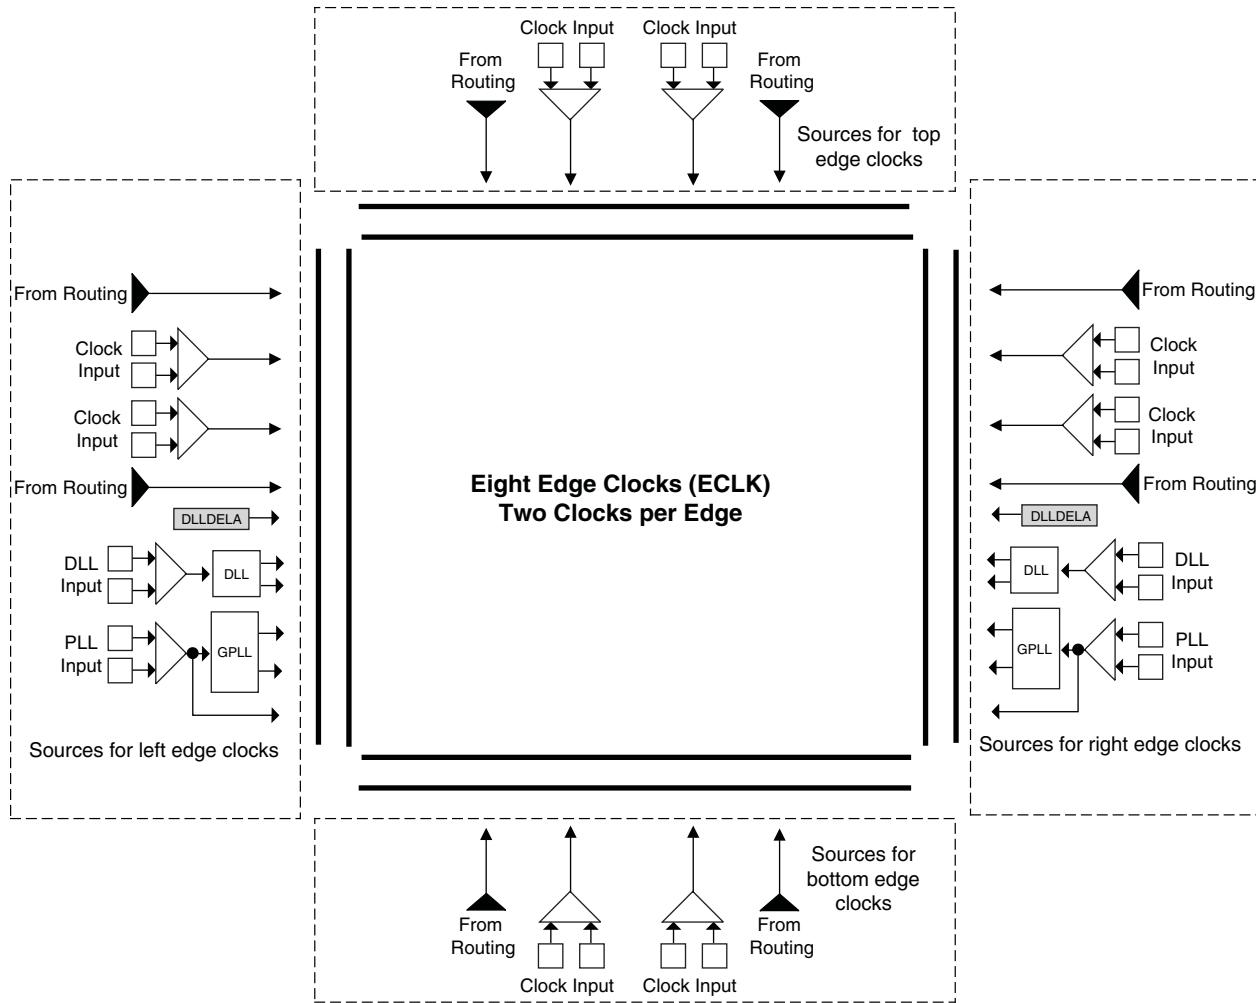

## **Clock Dividers**

LatticeECP2/M devices have two clock dividers, one on the left side and one on the right side of the device. These are intended to generate a slower-speed system clock from a high-speed edge clock. The block operates in a  $\div 2$ ,  $\div 4$  or  $\div 8$  mode and maintains a known phase relationship between the divided down clock and the high-speed clock based on the release of its reset signal. The clock dividers can be fed from selected PLL/DLL outputs, DLL-DELA delay blocks, routing or from an external clock input. The clock divider outputs serve as primary clock sources and feed into the clock distribution network. The Reset (RST) control signal resets input and synchronously forces all outputs to low. The RELEASE signal releases outputs synchronously to the input clock. For further information about clock dividers, please see the list of additional technical documentation at the end of this data sheet. Figure 2-9 shows the clock divider connections.

## Edge Clock Sources

Edge clock resources can be driven from a variety of sources at the same edge. Edge clock resources can be driven from adjacent edge clock PIOs, primary clock PIOs, PLLs/DLLs and clock dividers as shown in Figure 2-12.

**Figure 2-12. Edge Clock Sources**

**Figure 2-16. Secondary Clock Selection**

## Slice Clock Selection

Figure 2-17 shows the clock selections and Figure 2-18 shows the control selections for Slice0 through Slice2. All the primary clocks and the four secondary clocks are routed to this clock selection mux. Other signals can be used as a clock input to the slices via routing. Slice controls are generated from the secondary clocks or other signals connected via routing.

If none of the signals are selected for both clock and control then the default value of the mux output is 1. Slice 3 does not have any registers; therefore it does not have the clock or control muxes.

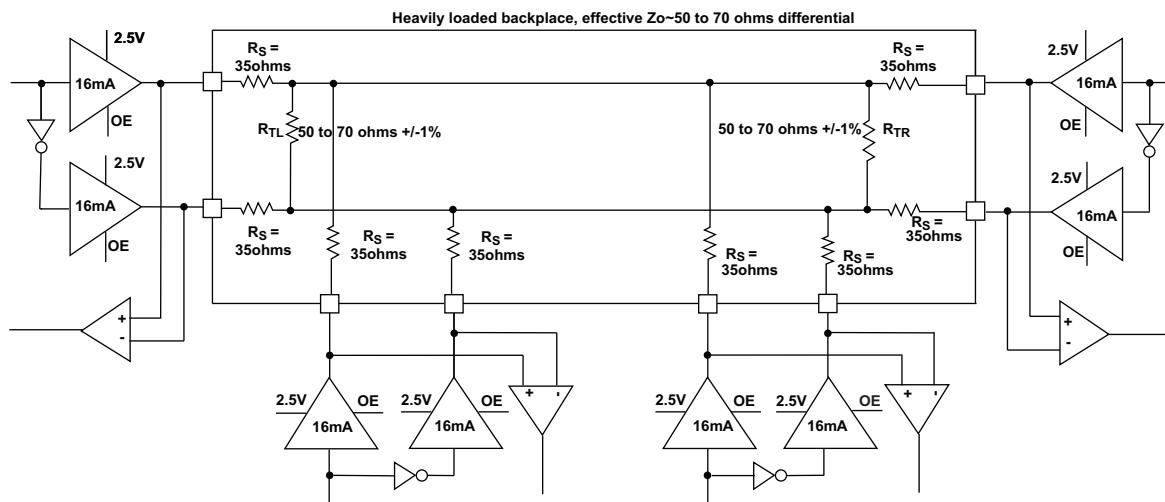

**Figure 2-17. Slice0 through Slice2 Clock Selection**

## MLVDS

The LatticeECP2/M devices support the differential MLVDS standard. This standard is emulated using complementary LVCMS outputs in conjunction with a parallel resistor across the driver outputs. The MLVDS input standard is supported by the LVDS differential input buffer. The scheme shown in Figure 3-5 is one possible solution for MLVDS standard implementation. Resistor values in Figure 3-5 are industry standard values for 1% resistors.

**Figure 3-5. MLVDS (Multipoint Low Voltage Differential Signaling)**

**Table 3-6. MLVDS DC Conditions<sup>1</sup>**

Parameter	Description	Typical		Units
		Zo=50Ω	Zo=70Ω	
V <sub>CCIO</sub>	Output Driver Supply (+/-5%)	2.50	2.50	V
Z <sub>OUT</sub>	Driver Impedance	10.00	10.00	Ω
R <sub>S</sub>	Driver Series Resistor (+/-1%)	35.00	35.00	Ω
R <sub>TL</sub>	Driver Parallel Resistor (+/-1%)	50.00	70.00	Ω
R <sub>TR</sub>	Receiver Termination (+/-1%)	50.00	70.00	Ω
V <sub>OH</sub>	Output High Voltage	1.52	1.60	V
V <sub>OL</sub>	Output Low Voltage	0.98	0.90	V
V <sub>OD</sub>	Output Differential Voltage	0.54	0.70	V
V <sub>CM</sub>	Output Common Mode Voltage	1.25	1.25	V
I <sub>DC</sub>	DC Output Current	21.74	20.00	mA

1. For input buffer, see LVDS table.

For further information about LVPECL, RSDS, MLVDS, BLVDS and other differential interfaces please see the list of additional technical information at the end of this data sheet.

## Switching Test Conditions

Figure 3-22 shows the output test load that is used for AC testing. The specific values for resistance, capacitance, voltage, and other test conditions are shown in Table 3-19.

**Figure 3-22. Output Test Load, LVTTL and LVC MOS Standards**

\*CL Includes Test Fixture and Probe Capacitance

**Table 3-19. Test Fixture Required Components, Non-Terminated Interfaces**

Test Condition	R <sub>1</sub>	R <sub>2</sub>	C <sub>L</sub>	Timing Ref.	V <sub>T</sub>
LVTTL and other LVC MOS settings (L → H, H → L)	$\infty$	$\infty$	0pF	LVC MOS 3.3 = V <sub>CCIO</sub> /2	—
				LVC MOS 2.5 = V <sub>CCIO</sub> /2	—
				LVC MOS 1.8 = V <sub>CCIO</sub> /2	—
				LVC MOS 1.5 = V <sub>CCIO</sub> /2	—
				LVC MOS 1.2 = V <sub>CCIO</sub> /2	—
LVC MOS 2.5 I/O (Z → H)	$\infty$	1MΩ		V <sub>CCIO</sub> /2	—
LVC MOS 2.5 I/O (Z → L)	1MΩ	$\infty$		V <sub>CCIO</sub> /2	V <sub>CCIO</sub>
LVC MOS 2.5 I/O (H → Z)	$\infty$	100		V <sub>OH</sub> - 0.10	—
LVC MOS 2.5 I/O (L → Z)	100	$\infty$		V <sub>OL</sub> + 0.10	V <sub>CCIO</sub>

Note: Output test conditions for all other interfaces are determined by the respective standards.

- All grounds must be electrically connected at the board level. For fpBGA packages, the total number of GND balls is less than the actual number of GND logic connections from the die to the common package GND plane.
- NC pins should not be connected to any active signals, VCC or GND.
- Pin orientation A1 starts from the upper left corner of the top side view with alphabetical order ascending vertically and numerical order ascending horizontally.
