## Understanding [Embedded - FPGAs \(Field Programmable Gate Array\)](#)

Embedded - FPGAs, or Field Programmable Gate Arrays, are advanced integrated circuits that offer unparalleled flexibility and performance for digital systems. Unlike traditional fixed-function logic devices, FPGAs can be programmed and reprogrammed to execute a wide array of logical operations, enabling customized functionality tailored to specific applications. This reprogrammability allows developers to iterate designs quickly and implement complex functions without the need for custom hardware.

## Applications of Embedded - FPGAs

The versatility of Embedded - FPGAs makes them indispensable in numerous fields. In telecommunications,

### Details

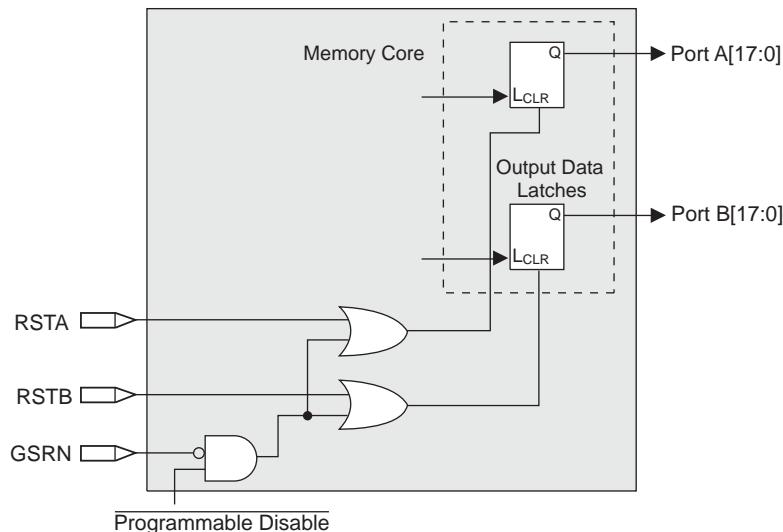

Product Status	Active
Number of LABs/CLBs	2375
Number of Logic Elements/Cells	19000
Total RAM Bits	1246208
Number of I/O	304
Number of Gates	-
Voltage - Supply	1.14V ~ 1.26V
Mounting Type	Surface Mount
Operating Temperature	0°C ~ 85°C (TJ)
Package / Case	484-BBGA
Supplier Device Package	484-FPBGA (23x23)
Purchase URL	<a href="https://www.e-xfl.com/product-detail/lattice-semiconductor/lfe2m20e-7fn484c">https://www.e-xfl.com/product-detail/lattice-semiconductor/lfe2m20e-7fn484c</a>

2. Write Through – A copy of the input data appears at the output of the same port during a write cycle. This mode is supported for all data widths.

## Memory Core Reset

The memory array in the EBR utilizes latches at the A and B output ports. These latches can be reset asynchronously or synchronously. RSTA and RSTB are local signals, which reset the output latches associated with Port A and Port B, respectively. The Global Reset (GSRN) signal resets both ports. The output data latches and associated resets for both ports are as shown in Figure 2-20.

**Figure 2-20. Memory Core Reset**

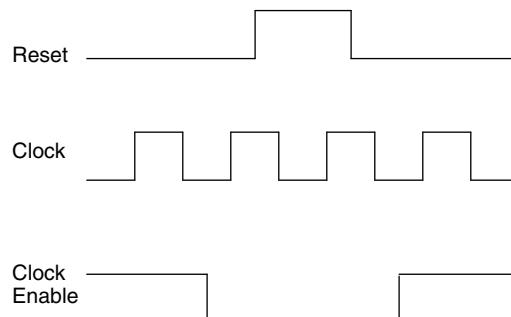

For further information about the sysMEM EBR block, please see the the list of additional technical documentation at the end of this data sheet.

## EBR Asynchronous Reset

EBR asynchronous reset or GSR (if used) can only be applied if all clock enables are low for a clock cycle before the reset is applied and released a clock cycle after the reset is released, as shown in Figure 2-21. The GSR input to the EBR is always asynchronous.

**Figure 2-21. EBR Asynchronous Reset (Including GSR) Timing Diagram**

If all clock enables remain enabled, the EBR asynchronous reset or GSR may only be applied and released after the EBR read and write clock inputs are in a steady state condition for a minimum of  $1/f_{MAX}$  (EBR clock). The reset release must adhere to the EBR synchronous reset setup time before the next active read or write clock edge.

If an EBR is pre-loaded during configuration, the GSR input must be disabled or the release of the GSR during device Wake Up must occur before the release of the device I/Os becomes active.

These instructions apply to all EBR RAM and ROM implementations.

Note that there are no reset restrictions if the EBR synchronous reset is used and the EBR GSR input is disabled.

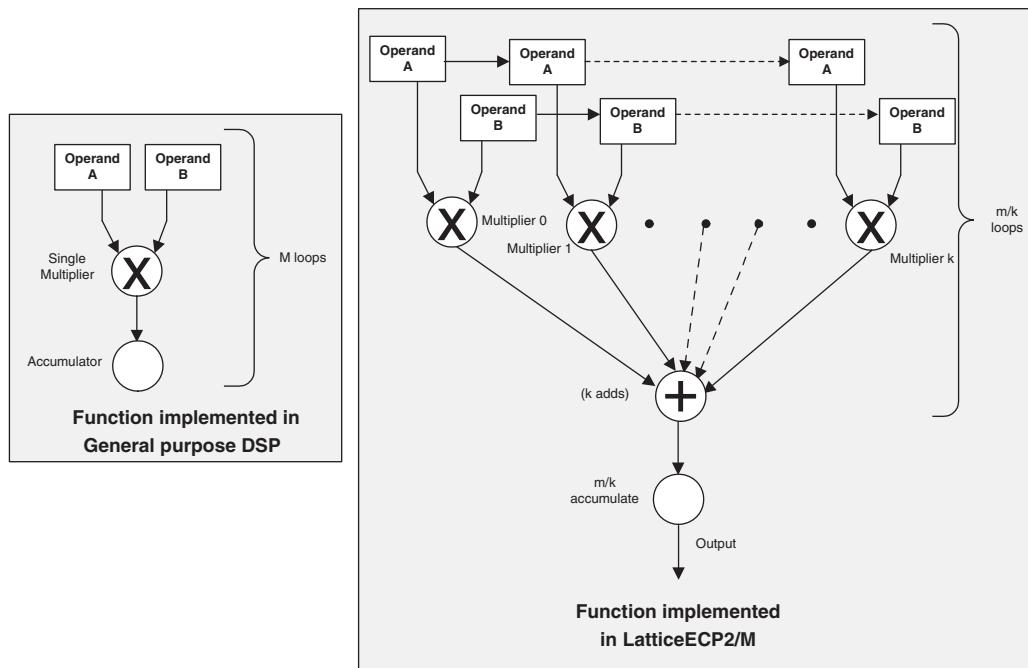

## sysDSP™ Block

The LatticeECP2/M family provides a sysDSP block, making it ideally suited for low cost, high performance Digital Signal Processing (DSP) applications. Typical functions used in these applications are Finite Impulse Response (FIR) filters, Fast Fourier Transforms (FFT) functions, Correlators, Reed-Solomon/Turbo/Convolution encoders and decoders. These complex signal processing functions use similar building blocks such as multiply-adders and multiply-accumulators.

### sysDSP Block Approach Compared to General DSP

Conventional general-purpose DSP chips typically contain one to four (Multiply and Accumulate) MAC units with fixed data-width multipliers; this leads to limited parallelism and limited throughput. Their throughput is increased by higher clock speeds. The LatticeECP2/M, on the other hand, has many DSP blocks that support different data-widths. This allows the designer to use highly parallel implementations of DSP functions. The designer can optimize the DSP performance vs. area by choosing an appropriate level of parallelism. Figure 2-22 compares the fully serial and the mixed parallel and serial implementations.

**Figure 2-22. Comparison of General DSP and LatticeECP2/M Approaches**

## sysDSP Block Capabilities

The sysDSP block in the LatticeECP2/M family supports four functional elements in three 9, 18 and 36 data path widths. The user selects a function element for a DSP block and then selects the width and type (signed/unsigned) of its operands. The operands in the LatticeECP2/M family sysDSP Blocks can be either signed or unsigned but not mixed within a function element. Similarly, the operand widths cannot be mixed within a block. In the LatticeECP2/M family the DSP elements can be concatenated.

The resources in each sysDSP block can be configured to support the following elements:

- MULT (Multiply)
- MAC (Multiply, Accumulate)
- MULTADDSUB (Multiply, Addition/Subtraction)
- MULTADDSUBSUM (Multiply, Addition/Subtraction, Accumulate)

The number of elements available on each block depends in the width selected from the three available options x9, x18, and x36. A number of these elements are concatenated for highly parallel implementations of DSP functions. Table 2-7 shows the capabilities of the block.

**Table 2-7. Maximum Number of Elements in a Block**

Width of Multiply	x9	x18	x36
MULT	8	4	1
MAC	2	2	—
MULTADDSUB	4	2	—
MULTADDSUBSUM	2	1	—

Some options are available in four elements. The input register in all the elements can be directly loaded or can be loaded as a shift register from previous operand registers. By selecting “dynamic operation” the following operations are possible:

- In the ‘Signed/Unsigned’ options the operands can be switched between signed and unsigned on every cycle.
- In the ‘Add/Sub’ option the Accumulator can be switched between addition and subtraction on every cycle.
- The loading of operands can switch between parallel and serial operations.

**Table 2-12. PIO Signals List**

Name	Type	Description
CE0, CE1	Control from the core	Clock enables for input and output block flip-flops
CLK0, CLK1	Control from the core	System clocks for input and output blocks
ECLK1, ECLK2	Control from the core	Fast edge clocks
LSR	Control from the core	Local Set/Reset
GSRN	Control from routing	Global Set/Reset (active low)
INCK <sup>2</sup>	Input to the core	Input to Primary Clock Network or PLL reference inputs
DQS	Input to PIO	DQS signal from logic (routing) to PIO
INDD	Input to the core	Unregistered data input to core
INFF	Input to the core	Registered input on positive edge of the clock (CLK0)
IPOS0, IPOS1	Input to the core	Double data rate registered inputs to the core
QPOS0 <sup>1</sup> , QPOS1 <sup>1</sup>	Input to the core	Gearbox pipelined inputs to the core
QNNEG0 <sup>1</sup> , QNEG1 <sup>1</sup>	Input to the core	Gearbox pipelined inputs to the core
OPOS0, ONEG0, OPOS2, ONEG2	Output data from the core	Output signals from the core for SDR and DDR operation
OPOS1 ONEG1	Tristate control from the core	Signals to Tristate Register block for DDR operation
DEL[3:0]	Control from the core	Dynamic input delay control bits
TD	Tristate control from the core	Tristate signal from the core used in SDR operation
DDRCLKPOL	Control from clock polarity bus	Controls the polarity of the clock (CLK0) that feed the DDR input block
DQSXFER	Control from core	Controls signal to the Output block

1. Signals available on left/right/bottom only.

2. Selected I/O.

## PIO

The PIO contains four blocks: an input register block, output register block, tristate register block and a control logic block. These blocks contain registers for operating in a variety of modes along with the necessary clock and selection logic.

### Input Register Block

The input register blocks for PIOs in left, right and bottom edges contain delay elements and registers that can be used to condition high-speed interface signals, such as DDR memory interfaces and source synchronous interfaces, before they are passed to the device core. Figure 2-29 shows the diagram of the input register block for left, right and bottom edges. The input register block for the top edge contains one memory element to register the input signal as shown in Figure 2-30. The following description applies to the input register block for PIOs in the left, right and bottom edges of the device.

Input signals are fed from the sysl/O buffer to the input register block (as signal DI). If desired, the input signal can bypass the register and delay elements and be used directly as a combinatorial signal (INDD), a clock (INCK) and, in selected blocks, the input to the DQS delay block. If an input delay is desired, designers can select either a fixed delay or a dynamic delay DEL[3:0]. The delay, if selected, reduces input register hold time requirements when using a global clock.

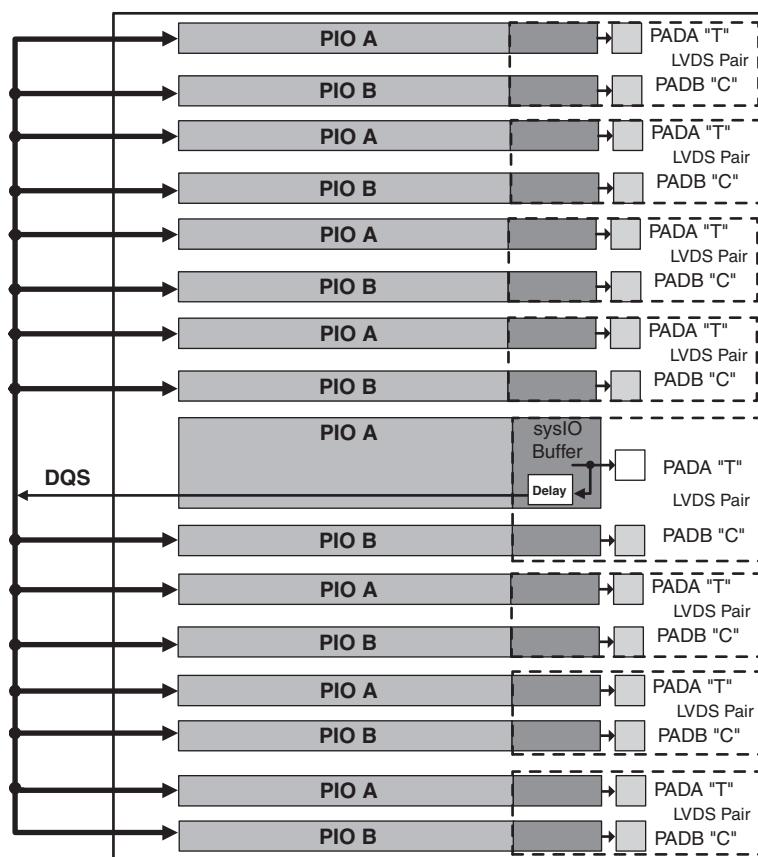

The input block allows three modes of operation. In the single data rate (SDR) the data is registered, by one of the registers in the single data rate sync register block, with the system clock. In DDR Mode, two registers are used to sample the data on the positive and negative edges of the DQS signal, creating two data streams, D0 and D1. These two data streams are synchronized with the system clock before entering the core. Further discussion on this topic is in the DDR Memory section of this data sheet.

## Top Edge

The PICs on the top edge are different from PIOs on the left, right and bottom edges. PIOs on this edge do not have DDR registers or DQS signals.

The exact DQS pins are shown in a dual function in the Logic Signal Connections table in this data sheet. Additional detail is provided in the Signal Descriptions table. The DQS signal from the bus is used to strobe the DDR data from the memory into input register blocks. Interfaces on the left and right edges are designed for DDR memories that support 16 bits of data, whereas interfaces on the bottom are designed for memories that support 18 bits of data.

**Figure 2-33. DQS Input Routing for the Left and Right Edges of the Device**

# LatticeECP2/M Family Data Sheet

## DC and Switching Characteristics

September 2013

Data Sheet DS1006

### Absolute Maximum Ratings<sup>1, 2, 3</sup>

Supply Voltage V <sub>CC</sub> . . . . .	-0.5 to 1.32V
Supply Voltage V <sub>CCAUX</sub> . . . . .	-0.5 to 3.75V
Supply Voltage V <sub>CCJ</sub> . . . . .	-0.5 to 3.75V
Output Supply Voltage V <sub>CCIO</sub> . . . . .	-0.5 to 3.75V
Input or I/O Tristate Voltage Applied <sup>4</sup> . . . . .	-0.5 to 3.75V
Storage Temperature (Ambient) . . . . .	-65 to 150°C
Junction Temperature (T <sub>j</sub> ) . . . . .	+125°C

1. Stress above those listed under the "Absolute Maximum Ratings" may cause permanent damage to the device. Functional operation of the device at these or any other conditions above those indicated in the operational sections of this specification is not implied.
2. Compliance with the Lattice [Thermal Management](#) document is required.
3. All voltages referenced to GND.
4. Overshoot and undershoot of -2V to (V<sub>IHMAX</sub> + 2) volts is permitted for a duration of <20ns.

### Recommended Operating Conditions<sup>7</sup>

Symbol	Parameter	Min.	Max.	Units
V <sub>CC</sub> <sup>1, 4, 5</sup>	Core Supply Voltage	1.14	1.26	V
V <sub>CCAUX</sub> <sup>1, 3, 4, 5</sup>	Auxiliary Supply Voltage	3.135	3.465	V
V <sub>CCPLL</sub>	PLL Supply Voltage	1.14	1.26	V
V <sub>CCIO</sub> <sup>1, 2, 4</sup>	I/O Driver Supply Voltage	1.14	3.465	V
V <sub>CCJ</sub> <sup>1</sup>	Supply Voltage for IEEE 1149.1 Test Access Port	1.14	3.465	V
t <sub>JCOM</sub>	Junction Temperature, Commercial Operation	0	85	°C
t <sub>JIND</sub>	Junction Temperature, Industrial Operation	-40	100	°C
SERDES External Power Supply (For LatticeECP2M Family Only)				
V <sub>CCIB</sub>	Input Buffer Power Supply (1.2V)	1.14	1.26	V
	Input Buffer Power Supply (1.5V)	1.425	1.575	V
V <sub>CCOB</sub>	Output Buffer Power Supply (1.2V)	1.14	1.26	V
	Output Buffer Power Supply (1.5V)	1.425	1.575	V
V <sub>CCAUX33</sub>	Termination Resistor Switching Power Supply	3.135	3.465	V
V <sub>CCRX</sub> <sup>6</sup>	Receive Power Supply	1.14	1.26	V
V <sub>CCTX</sub> <sup>6</sup>	Transmit Power Supply	1.14	1.26	V

Date	Version	Section	Change Summary
August 2006 (cont.)	01.1 (cont.)	Pinout Information (cont.)	Added Information on: Available Device Resources per Packaged Device table.
		Ordering Information	Updated ordering part number table to include ECP2-12.
			Updated topside mark drawing.
September 2006	02.0	Multiple	Added information regarding LatticeECP2M support throughout.
September 2006	02.1	DC and Switching Characteristics	Added Receiver Total Jitter Tolerance Specification table.
			Removed power-up requirements for proper configuration footnote in Recommended Operating Conditions table.
December 2006	02.2	Introduction	LatticeECP2M Selection Guide table has been updated.
		Architecture	Figure 2-16. Per Region Secondary Clock Selection has been updated.
			Figure 2-39. Simplified Channel Block Diagram for SERDES and PCS has been updated.
		DC and Switching	Footnotes have been added to Recommended Operating Conditions.
			DC Electrical Characteristics table has been updated.
			Supply Current (Standby) tables have been updated.
			Initialization Supply Current table have been updated.
			Updated timing numbers to include LFE2-12E (rev A 0.08).
		Pinout Information	Updated to include the entire ECP2 device information as well as 256-fpBGA and 484-fpBGA pin information for the ECP2M35E.
		Ordering Information	Updated to include the entire ECP2 and ECP2M device ordering information.
February 2007	02.3	Architecture	Updated EBR Asynchronous Reset section.
March 2007	02.4	DC and Switching Characteristics	Power-sequencing footnotes have been added to the Recommended Operating Conditions. DDR2 performance has been updated to 266MHz.
March 2007	02.5	Introduction	Added "Security Series" to the LatticeECP2 and LatticeECP2M families.
		Architecture	Enhanced Configuration Option section updated.
		DC and Switching	Recommended Operating Conditions table - footnote 4 updated.
		Ordering Information	"Security Series" ordering part numbers added.
April 2007	02.6	Introduction	LatticeECP2M family table has been updated for user I/O counts.
		Ordering Information	LatticeECP2M family ordering part number section has been updated to add 1152-fpBGA package for the ECP2M70 and ECP2M100.
July 2007	02.7	Architecture	Updated text in Ripple Mode section.
		DC and Switching	ECP2/M Supply Current information has been updated. Typical Building Block Function Performance, External Switching Characteristics, Internal Switching Characteristics, Family Timing Adders, sysCLOCK GPLL Timing, sysCLOCK SPLL Timing, DLL Timing and sysCONFIG Port Timing Specifications have been updated (timing rev. A 0.10). SERDES timing information has been updated. PCI Express timing information has been updated.
		Pinout Information	Added LatticeECP2M20 pinout information.
August 2007	02.8	Introduction	1156-fpBGA package option has been removed from the LatticeECP2M family.
		Architecture	Table 2-16. Selectable Master Clock (CCLK) Frequencies During Configuration table has been updated.
		DC and Switching	Supply Current (Standby) table has been updated.
			DSP Function timing has been updated.
