## Understanding Embedded - FPGAs (Field Programmable Gate Array)

Embedded - FPGAs, or Field Programmable Gate Arrays, are advanced integrated circuits that offer unparalleled flexibility and performance for digital systems. Unlike traditional fixed-function logic devices, FPGAs can be programmed and reprogrammed to execute a wide array of logical operations, enabling customized functionality tailored to specific applications. This reprogrammability allows developers to iterate designs quickly and implement complex functions without the need for custom hardware.

## **Applications of Embedded - FPGAs**

The versatility of Embedded - FPGAs makes them indispensable in numerous fields. In telecommunications.

### Details

Product Status	Obsolete
Number of LABs/CLBs	4250
Number of Logic Elements/Cells	34000
Total RAM Bits	2151424
Number of I/O	303
Number of Gates	-
Voltage - Supply	1.14V ~ 1.26V
Mounting Type	Surface Mount
Operating Temperature	0°C ~ 85°C (TJ)
Package / Case	484-BBGA
Supplier Device Package	484-FPBGA (23x23)
Purchase URL	<a href="https://www.e-xfl.com/product-detail/lattice-semiconductor/lfe2m35se-7f484c">https://www.e-xfl.com/product-detail/lattice-semiconductor/lfe2m35se-7f484c</a>

**Table 1-2. LatticeECP2M (Including “S-Series”) Family Selection**

Device	ECP2M20	ECP2M35	ECP2M50	ECP2M70	ECP2M100
LUTs (K)	19	34	48	67	95
sysMEM Blocks (18kb)	66	114	225	246	288

1152-ball fpBGA (35 x 35 mm)				16 / 436	16 / 520

## Introduction

The LatticeECP2/M family of FPGA devices is optimized to deliver high performance features such as advanced DSP blocks, high speed SERDES (LatticeECP2M family only) and high speed source synchronous interfaces in an economical FPGA fabric. This combination was achieved through advances in device architecture and the use of 90nm technology.

The LatticeECP2/M FPGA fabric is optimized with high performance and low cost in mind. The LatticeECP2/M devices include LUT-based logic, distributed and embedded memory, Phase Locked Loops (PLLs), Delay Locked Loops (DLLs), pre-engineered source synchronous I/O support, enhanced sysDSP blocks and advanced configuration support, including encryption (“S” versions only) and dual boot capabilities.

The LatticeECP2M device family features high speed SERDES with PCS. These high jitter tolerance and low transmission jitter SERDES with PCS blocks can be configured to support an array of popular data protocols including PCI Express, Ethernet (1GbE and SGMII), OBSAI and CPRI. Transmit Pre-emphasis and Receive Equalization settings make SERDES suitable for chip to chip and small form factor backplane applications.

Lattice Diamond® design software allows large complex designs to be efficiently implemented using the LatticeECP2/M FPGA family. Synthesis library support for LatticeECP2/M is available for popular logic synthesis tools. The Diamond software uses the synthesis tool output along with the constraints from its floor planning tools to place and route the design in the LatticeECP2/M device. The Diamond design tool extracts the timing from the routing and back-annotates it into the design for timing verification.

Lattice provides many pre-engineered IP (Intellectual Property) modules for the LatticeECP2/M family. By using these IP cores as standardized blocks, designers are free to concentrate on the unique aspects of their design, increasing their productivity.

## Delay Locked Loops (DLL)

In addition to PLLs, the LatticeECP2/M family of devices has two DLLs per device.

CLKI is the input frequency (generated either from the pin or routing) for the DLL. CLKI feeds into the output muxes block to bypass the DLL, directly to the DELAY CHAIN block and (directly or through divider circuit) to the reference input of the Phase Frequency Detector (PFD) input mux. The reference signal for the PFD can also be generated from the Delay Chain and CLKFB signals. The feedback input to the PFD is generated from the CLKFB pin, CLKI or from tapped signal from the Delay chain.

The PFD produces a binary number proportional to the phase and frequency difference between the reference and feedback signals. This binary output of the PFD is fed into a Arithmetic Logic Unit (ALU). Based on these inputs, the ALU determines the correct digital control codes to send to the delay chain in order to better match the reference and feedback signals. This digital code from the ALU is also transmitted via the Digital Control bus (DCNTL) bus to its associated DLLDELA delay block. The ALUHOLD input allows the user to suspend the ALU output at its current value. The UDDCNTL signal allows the user to latch the current value on the DCNTL bus.

The DLL has two independent clock outputs, CLKOP and CLKOS. These outputs can individually select one of the outputs from the tapped delay line. The CLKOS has optional fine phase shift and divider blocks to allow this output to be further modified, if required. The fine phase shift block allows the CLKOS output to phase shifted a further 45, 22.5 or 11.25 degrees relative to its normal position. Both the CLKOS and CLKOP outputs are available with optional duty cycle correction. Divide by two and divide by four frequencies are available at CLKOS. The LOCK output signal is asserted when the DLL is locked. Figure 2-6 shows the DLL block diagram and Table 2-5 provides a description of the DLL inputs and outputs.

The user can configure the DLL for many common functions such as time reference delay mode and clock injection removal mode. Lattice provides primitives in its design tools for these functions. For more information about the DLL, please see the list of additional technical documentation at the end of this data sheet.

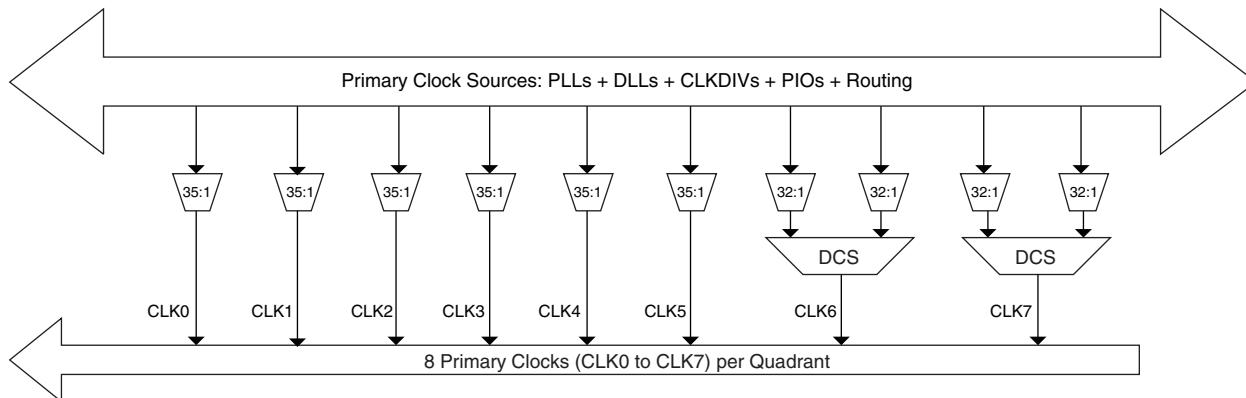

**Figure 2-6. Delay Locked Loop Diagram (DLL)**

## Primary Clock Routing

The clock routing structure in LatticeECP2/M devices consists of a network of eight primary clock lines (CLK0 through CLK7) per quadrant. The primary clocks of each quadrant are generated from muxes located in the center of the device. All the clock sources are connected to these muxes. Figure 2-13 shows the clock routing for one quadrant. Each quadrant mux is identical. If desired, any clock can be routed globally

**Figure 2-13. Per Quadrant Primary Clock Selection**

## Dynamic Clock Select (DCS)

The DCS is a smart multiplexer function available in the primary clock routing. It switches between two independent input clock sources without any glitches or runt pulses. This is achieved regardless of when the select signal is toggled. There are two DCS blocks per quadrant; in total, there are eight DCS blocks per device. The inputs to the DCS block come from the center muxes. The output of the DCS is connected to primary clocks CLK6 and CLK7 (see Figure 2-13).

Figure 2-14 shows the timing waveforms of the default DCS operating mode. The DCS block can be programmed to other modes. For more information about the DCS, please see the list of additional technical documentation at the end of this data sheet.

**Figure 2-14. DCS Waveforms**

## Secondary Clock/Control Routing

Secondary clocks in the LatticeECP2 devices are region-based resources. The benefit of region-based resources is the relatively low injection delay and skew within the region, as compared to primary clocks. EBR/DSP rows and a special vertical routing channel bound the secondary clock regions. This special vertical routing channel aligns with either the left edge of the center DSP block in the DSP row or the center of the DSP row. Figure 2-15 shows

## LatticeECP2M Supply Current (Standby)<sup>1, 2, 3, 4</sup>

Over Recommended Operating Conditions

Symbol	Parameter	Device	Typ. <sup>5</sup>	Units
$I_{CC}$	Core Power Supply Current	ECP2M20	25	mA
		ECP2M35	50	mA
		ECP2M50	85	mA
		ECP2M70	100	mA
		ECP2M100	100	mA
$I_{CCAUX}$	Auxiliary Power Supply Current	ECP2M20	24	mA
		ECP2M35	24	mA
		ECP2M50	24	mA
		ECP2M70	24	mA
		ECP2M100	24	mA
$I_{CCGPLL}$	GPLL Power Supply Current (per GPLL)	All Devices	0.5	mA
$I_{CCSPLL}$	SPLL Power Supply Current (per SPLL)	All Devices	0.5	mA
$I_{CCIO}$	Bank Power Supply Current (Per Bank)	ECP2M20	2	mA
		ECP2M35	2	mA
		ECP2M50	2	mA
		ECP2M70	2	mA
		ECP2M100	2	mA
$I_{CCJ}$	$V_{CCJ}$ Power Supply Current	All Devices	3	mA

1. For further information about supply current, please see the list of additional technical documentation at the end of this data sheet.
2. Assumes all outputs are tristated, all inputs are configured as LVCMS and held at the  $V_{CCIO}$  or GND.
3. Frequency 0MHz.
4. Pattern represents a “blank” configuration data file.
5.  $T_J = 25^\circ\text{C}$ , power supplies at normal voltage.

## LatticeECP2 Initialization Supply Current<sup>1, 2, 3, 4</sup>

### Over Recommended Operating Conditions

Symbol	Parameter	Device	Typ. <sup>5, 6, 7</sup>	Units
$I_{CC}$	Core Power Supply Current	ECP2-6	34	mA
		ECP2-12	54	mA
		ECP2-20	82	mA
		ECP2-35	135	mA
		ECP2-50	187	mA
		ECP2-70	267	mA
$I_{CCAU}$	Auxiliary Power Supply Current	ECP2-6	30	mA
		ECP2-12	30	mA
		ECP2-20	30	mA
		ECP2-35	30	mA
		ECP2-50	30	mA
		ECP2-70	30	mA
$I_{CCPLL}$	GPLL Power Supply Current (per GPLL)	ECP2-35, -50, -70 Only	0.5	mA
$I_{CCSPLL}$	SPLL Power Supply Current (per SPLL)	ECP2-35, -50, -70 Only	0.5	mA
$I_{CCIO}$	Bank Power Supply Current (per Bank)	All Devices	3	mA
$I_{CCJ}$	VCCJ Power Supply Current	All Devices	4	mA

1. Until DONE signal is active.
2. For further information about supply current, please see the list of additional technical documentation at the end of this data sheet.
3. Assumes all outputs are tristated, all inputs are configured as LVCMOS and held at the  $V_{CCIO}$  or GND.
4. Frequency 0MHz.
5.  $T_J = 25^\circ\text{C}$ , power supplies at nominal voltage.
6. A specific configuration pattern is used that scales with the size of the device; consists of 75% PFU utilization, 50% EBR, and 25% I/O configuration.
7. Values shown in this column are the typical average DC current during configuration. Use the Power Calculator tool to find the peak startup current.

## LFE2M100E/SE Logic Signal Connections: 900 fpBGA (Cont.)

LFE2M100E/SE				
Ball Number	Ball/Pad Function	Bank	Dual Function	Differential
V18	VCCPLL	-		

\* Supports true LVDS. Other differential signals must be emulated with external resistors.

\*\* These dedicated input pins can be used for GPLLS or GDLLs within the respective quadrant.

\*\*\* These sysCONFIG pins are dedicated I/O pins for configuration. The outputs are actively driven during normal device operation.

\*\*\*\*Due to packaging bond out option, this DQS does not have all the necessary DQ pins bonded out for a full 8-bit data width.

Note: VCCIO and GND pads are used to determine the average DC current drawn by I/Os between GND/VCCIO connections, or between the last GND/VCCIO in an I/O bank and the end of an I/O bank. The substrate pads listed in the Pin Table do not necessarily have a one to one connection with a package ball or pin.

**LFE2M70E/SE and LFE2M100E/SE Logic Signal Connections: 1152 fpBGA (Cont.)**
