## Understanding [Embedded - FPGAs \(Field Programmable Gate Array\)](#)

Embedded - FPGAs, or Field Programmable Gate Arrays, are advanced integrated circuits that offer unparalleled flexibility and performance for digital systems. Unlike traditional fixed-function logic devices, FPGAs can be programmed and reprogrammed to execute a wide array of logical operations, enabling customized functionality tailored to specific applications. This reprogrammability allows developers to iterate designs quickly and implement complex functions without the need for custom hardware.

## Applications of Embedded - FPGAs

The versatility of Embedded - FPGAs makes them indispensable in numerous fields. In telecommunications.

### Details

|                                |                                                                                                                                                                       |

**Table 2-5. DLL Signals**

| Signal     | I/O | Description                                                                   |
|------------|-----|-------------------------------------------------------------------------------|
| CLKI       | I   | Clock input from external pin or routing                                      |
| CLKFB      | I   | DLL feed input from DLL output, clock net, routing or external pin            |
| RSTN       | I   | Active low synchronous reset                                                  |
| ALUHOLD    | I   | Active high freezes the ALU                                                   |
| UDDCNTL    | I   | Synchronous enable signal (hold high for two cycles) from routing             |
| DCNTL[8:0] | O   | Encoded digital control signals for PIC INDEL and slave delay calibration     |
| CLKOP      | O   | The primary clock output                                                      |
| CLKOS      | O   | The secondary clock output with fine phase shift and/or division by 2 or by 4 |
| LOCK       | O   | Active high phase lock indicator                                              |

## DLLDELA Delay Block

Closely associated with each DLL is a DLLDELA block. This is a delay block consisting of a delay line with taps and a selection scheme that selects one of the taps. The DCNTL[8:0] bus controls the delay of the CLKO signal. Typically this is the delay setting that the DLL uses to achieve phase alignment. This results in the delay providing a calibrated 90° phase shift that is useful in centering a clock in the middle of a data cycle for source synchronous data. The CLKO signal feeds the edge clock network. Figure 2-7 shows the connections between the DLL block and the DLLDELA delay block. For more information, please see the list of additional technical documentation at the end of this data sheet.

**Figure 2-7. DLLDELA Delay Block**

## PLL/DLL Cascading

LatticeECP2/M devices have been designed to allow certain combinations of PLL (GPLL and SPLL) and DLL cascading. The allowable combinations are:

- PLL to PLL supported
- PLL to DLL supported

**Figure 2-10. Primary Clock Sources for ECP2-50**

Note: This diagram shows sources for the ECP2-50 device. Smaller LatticeECP2 devices have fewer SPPLLs. All LatticeECP2M devices have six SPPLLs.

## Primary Clock Routing

The clock routing structure in LatticeECP2/M devices consists of a network of eight primary clock lines (CLK0 through CLK7) per quadrant. The primary clocks of each quadrant are generated from muxes located in the center of the device. All the clock sources are connected to these muxes. Figure 2-13 shows the clock routing for one quadrant. Each quadrant mux is identical. If desired, any clock can be routed globally

**Figure 2-13. Per Quadrant Primary Clock Selection**

## Dynamic Clock Select (DCS)

The DCS is a smart multiplexer function available in the primary clock routing. It switches between two independent input clock sources without any glitches or runt pulses. This is achieved regardless of when the select signal is toggled. There are two DCS blocks per quadrant; in total, there are eight DCS blocks per device. The inputs to the DCS block come from the center muxes. The output of the DCS is connected to primary clocks CLK6 and CLK7 (see Figure 2-13).

Figure 2-14 shows the timing waveforms of the default DCS operating mode. The DCS block can be programmed to other modes. For more information about the DCS, please see the list of additional technical documentation at the end of this data sheet.

**Figure 2-14. DCS Waveforms**

## Secondary Clock/Control Routing

Secondary clocks in the LatticeECP2 devices are region-based resources. The benefit of region-based resources is the relatively low injection delay and skew within the region, as compared to primary clocks. EBR/DSP rows and a special vertical routing channel bound the secondary clock regions. This special vertical routing channel aligns with either the left edge of the center DSP block in the DSP row or the center of the DSP row. Figure 2-15 shows

Figure 2-28. PIC Diagram

\*Signals are available on left/right/bottom edges only.  
\*\* Selected blocks.

Two adjacent PIOs can be joined to provide a differential I/O pair (labeled as “T” and “C”) as shown in Figure 2-28. The PAD Labels “T” and “C” distinguish the two PIOs. Approximately 50% of the PIO pairs on the left and right edges of the device can be configured as true LVDS outputs. All I/O pairs can operate as inputs.

**Figure 2-30. Input Register Block Top Edge**

## Output Register Block

The output register block provides the ability to register signals from the core of the device before they are passed to the sysI/O buffers. The blocks on the PIOs on the left, right and bottom contain a register for SDR operation that is combined with an additional latch for DDR operation. Figure 2-31 shows the diagram of the Output Register Block for PIOs on the left, right and the bottom edges. Figure 2-32 shows the diagram of the Output Register Block for PIOs on the top edge of the device.

In SDR mode, ONEG0 feeds one of the flip-flops that then feeds the output. The flip-flop can be configured as a D-type or latch. In DDR mode, ONEG0 and OPOS0 are fed into registers on the positive edge of the clock. Then at the next clock cycle this registered OPOS0 is latched. A multiplexer running off the same clock selects the correct register for feeding to the output (D0).

By combining the output blocks of the complementary PIOs and sharing some registers from input blocks, a gearbox function can be implemented, that takes four data streams: ONEG0A, ONEG1A, ONEG1B and ONEG1B. Figure 2-32 shows the diagram using this gearbox function. For more information about this topic, please see information regarding additional documentation at the end of this data sheet.

# LatticeECP2/M Family Data Sheet

## DC and Switching Characteristics

September 2013

Data Sheet DS1006

### Absolute Maximum Ratings<sup>1, 2, 3</sup>

Supply Voltage  $V_{CC}$  . . . . . -0.5 to 1.32V

Supply Voltage  $V_{CCAUX}$  . . . . . -0.5 to 3.75V

Supply Voltage  $V_{CCJ}$  . . . . . -0.5 to 3.75V

Output Supply Voltage  $V_{CCIO}$  . . . . . -0.5 to 3.75V

Input or I/O Tristate Voltage Applied<sup>4</sup> . . . . . -0.5 to 3.75V

Storage Temperature (Ambient) . . . . . -65 to 150°C

Junction Temperature ( $T_j$ ) . . . . . +125°C

1. Stress above those listed under the "Absolute Maximum Ratings" may cause permanent damage to the device. Functional operation of the device at these or any other conditions above those indicated in the operational sections of this specification is not implied.
2. Compliance with the Lattice [Thermal Management](#) document is required.
3. All voltages referenced to GND.
4. Overshoot and undershoot of -2V to ( $V_{IHMAX} + 2$ ) volts is permitted for a duration of <20ns.

### Recommended Operating Conditions<sup>7</sup>

| Symbol                                                             | Parameter                                       | Min.  | Max.  | Units |
|--------------------------------------------------------------------|-------------------------------------------------|-------|-------|-------|

|                                                                    | Output Buffer Power Supply (1.5V)               | 1.425 | 1.575 | V     |
| $V_{CCAUX33}$                                                      | Termination Resistor Switching Power Supply     | 3.135 | 3.465 | V     |
| $V_{CCR}^6$                                                        | Receive Power Supply                            | 1.14  | 1.26  | V     |
| $V_{CCT}^6$                                                        | Transmit Power Supply                           | 1.14  | 1.26  | V     |

### RSDS

The LatticeECP2/M devices support differential RSDS standard. This standard is emulated using complementary LVCMOS outputs in conjunction with a parallel resistor across the driver outputs. The RSDS input standard is supported by the LVDS differential input buffer. The scheme shown in Figure 3-4 is one possible solution for RSDS standard implementation. Resistor values in Figure 3-4 are industry standard values for 1% resistors.

**Figure 3-4. RSDS (Reduced Swing Differential Signaling)**

**Table 3-5. RSDS DC Conditions<sup>1</sup>**

#### Over Recommended Operating Conditions

| Parameter         | Description                      | Typical | Units |
|-------------------|----------------------------------|---------|-------|
| V <sub>CCIO</sub> | Output Driver Supply (+/-5%)     | 2.50    | V     |
| Z <sub>OUT</sub>  | Driver Impedance                 | 20      | Ω     |
| R <sub>S</sub>    | Driver Series Resistor (+/-1%)   | 294     | Ω     |
| R <sub>P</sub>    | Driver Parallel Resistor (+/-1%) | 121     | Ω     |
| R <sub>T</sub>    | Receiver Termination (+/-1%)     | 100     | Ω     |
| V <sub>OH</sub>   | Output High Voltage              | 1.35    | V     |
| V <sub>OL</sub>   | Output Low Voltage               | 1.15    | V     |
| V <sub>OD</sub>   | Output Differential Voltage      | 0.20    | V     |
| V <sub>CM</sub>   | Output Common Mode Voltage       | 1.25    | V     |
| Z <sub>BACK</sub> | Back Impedance                   | 101.5   | Ω     |
| I <sub>DC</sub>   | DC Output Current                | 3.66    | mA    |

1. For input buffer, see LVDS table.

**Table 3-13. Periodic Receiver Jitter Tolerance Specification<sup>1</sup>**

| Description | Frequency             | Condition               | Min. | Typ. | Max. | Units   |
|-------------|-----------------------|-------------------------|------|------|------|---------|
| Periodic    | 3.125 Gbps            | 600 mV differential eye | —    | —    | 0.20 | UI, p-p |
|             | 2.5 Gbps              | 600 mV differential eye | —    | —    | 0.22 | UI, p-p |
|             | 1.25 Gbps             | 600 mV differential eye | —    | —    | 0.20 | UI, p-p |
|             | 250 Mbps <sup>2</sup> | 600 mV differential eye | —    | —    | 0.08 | UI, p-p |

1. Values are measured with PRBS 2<sup>7</sup>-1, all channels operating.

2. Jitter specification is limited by measurement equipment capability.

1. All grounds must be electrically connected at the board level. For fpBGA packages, the total number of GND balls is less than the actual number of GND logic connections from the die to the common package GND plane.
2. NC pins should not be connected to any active signals, VCC or GND.
3. For package migration across device densities, the designer must comprehend the package pin requirements for the SERDES blocks. Specifically, the SERDES power pins of the largest density device must be accounted to accommodate migration to other smaller devices using the same package. Please refer to TN1160, [LatticeECP2/M Density Migration](#) for more details.

## LFE2-12E/SE and LFE2-20E/SE Logic Signal Connections: 484 fpBGA (Cont.)

\* Supports true LVDS. Other differential signals must be emulated with external resistors.

\*\* These dedicated input pins can be used for GPPLLs or GDLLs within the respective quadrant.

\*\*\*Due to packaging bond out option, this DQS does not have all the necessary DQ pins bonded out for a full 8-bit data width.

Note: VCCIO and GND pads are used to determine the average DC current drawn by I/Os between GND/VCCIO connections, or between the last GND/VCCIO in an I/O bank and the end of an I/O bank. The substrate pads listed in the Pin Table do not necessarily have a one to one connection with a package ball or pin.
