

Welcome to E-XFL.COM

#### What is "Embedded - Microcontrollers"?

"Embedded - Microcontrollers" refer to small, integrated circuits designed to perform specific tasks within larger systems. These microcontrollers are essentially compact computers on a single chip, containing a processor core, memory, and programmable input/output peripherals. They are called "embedded" because they are embedded within electronic devices to control various functions, rather than serving as standalone computers. Microcontrollers are crucial in modern electronics, providing the intelligence and control needed for a wide range of applications.

Applications of "<u>Embedded -</u> <u>Microcontrollers</u>"

#### Details

E·XFI

| Product Status             | Obsolete  |
|----------------------------|---|
| Core Processor             | AVR   |
| Core Size                  | 8-Bit   |
| Speed                      | 16MHz   |
| Connectivity               | EBI/EMI, SPI, UART/USART  |
| Peripherals                | Brown-out Detect/Reset, POR, PWM, WDT                                     |
| Number of I/O              | 35  |
| Program Memory Size        | 8KB (4K x 16)   |
| Program Memory Type        | FLASH   |
| EEPROM Size                | 512 x 8   |
| RAM Size                   | 512 x 8   |
| Voltage - Supply (Vcc/Vdd) | 4.5V ~ 5.5V   |
| Data Converters            | -   |
| Oscillator Type            | Internal  |
| Operating Temperature      | -40°C ~ 85°C (TA)   |
| Mounting Type              | Surface Mount   |
| Package / Case             | 44-VFQFN Exposed Pad  |
| Supplier Device Package    | 44-VQFN (7x7)   |

2. \* NC = Do not connect (May be used in future devices)

### **Overview**

**Block Diagram** 

The ATmega8515 is a low-power CMOS 8-bit microcontroller based on the AVR enhanced RISC architecture. By executing powerful instructions in a single clock cycle, the ATmega8515 achieves throughputs approaching 1 MIPS per MHz allowing the system designer to optimize power consumption versus processing speed.

|   | The AVR core combines a rich instruction set with 32 general purpose working registers.<br>All the 32 registers are directly connected to the Arithmetic Logic Unit (ALU), allowing<br>two independent registers to be accessed in one single instruction executed in one clock<br>cycle. The resulting architecture is more code efficient while achieving throughputs up to<br>ten times faster than conventional CISC microcontrollers.   |
|---|--|
|   | The ATmega8515 provides the following features: 8K bytes of In-System Programmable<br>Flash with Read-While-Write capabilities, 512 bytes EEPROM, 512 bytes SRAM, an<br>External memory interface, 35 general purpose I/O lines, 32 general purpose working<br>registers, two flexible Timer/Counters with compare modes, Internal and External inter-<br>rupts, a Serial Programmable USART, a programmable Watchdog Timer with internal<br>Oscillator, a SPI serial port, and three software selectable power saving modes. The Idle<br>mode stops the CPU while allowing the SRAM, Timer/Counters, SPI port, and Interrupt<br>system to continue functioning. The Power-down mode saves the Register contents but<br>freezes the Oscillator, disabling all other chip functions until the next interrupt or hard-<br>ware reset. In Standby mode, the crystal/resonator Oscillator is running while the rest of<br>the device is sleeping. This allows very fast start-up combined with low-power<br>consumption. |
|   | The device is manufactured using Atmel's high density nonvolatile memory technology.<br>The On-chip ISP Flash allows the Program memory to be reprogrammed In-System<br>through an SPI serial interface, by a conventional nonvolatile memory programmer, or<br>by an On-chip Boot program running on the AVR core. The boot program can use any<br>interface to download the application program in the Application Flash memory. Soft-<br>ware in the Boot Flash section will continue to run while the Application Flash section is<br>updated, providing true Read-While-Write operation. By combining an 8-bit RISC CPU<br>with In-System Self-programmable Flash on a monolithic chip, the Atmel ATmega8515<br>is a powerful microcontroller that provides a highly flexible and cost effective solution to<br>many embedded control applications.   |
|   | The ATmega8515 is supported with a full suite of program and system development tools including: C Compilers, Macro assemblers, Program debugger/simulators, In-cir-cuit Emulators, and Evaluation kits.   |
| Disclaimer  | Typical values contained in this datasheet are based on simulations and characteriza-<br>tion of other AVR microcontrollers manufactured on the same process technology. Min<br>and Max values will be available after the device is characterized.  |
| AT90S4414/8515 and<br>ATmega8515<br>Compatibility | The ATmega8515 provides all the features of the AT90S4414/8515. In addition, several new features are added. The ATmega8515 is backward compatible with AT90S4414/8515 in most cases. However, some incompatibilities between the two microcontrollers exist. To solve this problem, an AT90S4414/8515 compatibility mode can be selected by programming the S8515C Fuse. ATmega8515 is 100% pin compatible with AT90S4414/8515, and can replace the AT90S4414/8515 on current printed circuit boards. However, the location of Fuse bits and the electrical characteristics differs between the two devices.  |
| AT90S4414/8515 Compatibility                      | Programming the S8515C Fuse will change the following functionality:   |
| Mode  | • The timed sequence for changing the Watchdog Time-out period is disabled. See<br>"Timed Sequences for Changing the Configuration of the Watchdog Timer" on page 53 for details.  |
|   | <ul> <li>The double buffering of the USART Receive Registers is disabled. See "AVR<br/>USART vs. AVR UART – Compatibility" on page 137 for details.</li> </ul>   |
|   | <ul> <li>PORTE(2:1) will be set as output, and PORTE0 will be set as input.</li> </ul>   |
|   |  |

| VCC             | Digital supply voltage.  |
|-----------------|--|
| GND             | Ground.  |
| Port A (PA7PA0) | Port A is an 8-bit bi-directional I/O port with internal pull-up resistors (selected for each bit). The Port A output buffers have symmetrical drive characteristics with both high sink and source capability. When pins PA0 to PA7 are used as inputs and are externally pulled low, they will source current if the internal pull-up resistors are activated. The Port A pins are tri-stated when a reset condition becomes active, even if the clock is not running. |
|                 | Port A also serves the functions of various special features of the ATmega8515 as listed on page 67.   |
| Port B (PB7PB0) | Port B is an 8-bit bi-directional I/O port with internal pull-up resistors (selected for each bit). The Port B output buffers have symmetrical drive characteristics with both high sink and source capability. As inputs, Port B pins that are externally pulled low will source current if the pull-up resistors are activated. The Port B pins are tri-stated when a reset condition becomes active, even if the clock is not running.                                |
|                 | Port B also serves the functions of various special features of the ATmega8515 as listed on page 67.   |
| Port C (PC7PC0) | Port C is an 8-bit bi-directional I/O port with internal pull-up resistors (selected for each bit). The Port C output buffers have symmetrical drive characteristics with both high sink and source capability. As inputs, Port C pins that are externally pulled low will source current if the pull-up resistors are activated. The Port C pins are tri-stated when a reset condition becomes active, even if the clock is not running.                                |
| Port D (PD7PD0) | Port D is an 8-bit bi-directional I/O port with internal pull-up resistors (selected for each bit). The Port D output buffers have symmetrical drive characteristics with both high sink and source capability. As inputs, Port D pins that are externally pulled low will source current if the pull-up resistors are activated. The Port D pins are tri-stated when a reset condition becomes active, even if the clock is not running.                                |
|                 | Port D also serves the functions of various special features of the ATmega8515 as listed on page 72.   |
| Port E(PE2PE0)  | Port E is an 3-bit bi-directional I/O port with internal pull-up resistors (selected for each bit). The Port E output buffers have symmetrical drive characteristics with both high sink and source capability. As inputs, Port E pins that are externally pulled low will source current if the pull-up resistors are activated. The Port E pins are tri-stated when a reset condition becomes active, even if the clock is not running.                                |
|                 | Port E also serves the functions of various special features of the ATmega8515 as listed on page 74.   |
| RESET           | Reset input. A low level on this pin for longer than the minimum pulse length will gener-<br>ate a reset, even if the clock is not running. The minimum pulse length is given in Table<br>18 on page 46. Shorter pulses are not guaranteed to generate a reset.  |
| XTAL1           | Input to the inverting Oscillator amplifier and input to the internal clock operating circuit.   |
| XTAL2           | Output from the inverting Oscillator amplifier.  |

### About Code Examples

This documentation contains simple code examples that briefly show how to use various parts of the device. These code examples assume that the part specific header file is included before compilation. Be aware that not all C Compiler vendors include bit definitions in the header files and interrupt handling in C is compiler dependent. Please confirm with the C Compiler documentation for more details.

Notes: 1. Refer to the USART description for details on how to access UBRRH and UCSRC.

2. For compatibility with future devices, reserved bits should be written to zero if accessed. Reserved I/O memory addresses should never be written.

3. Some of the Status Flags are cleared by writing a logical one to them. Note that the CBI and SBI instructions will operate on all bits in the I/O Register, writing a one back into any flag read as set, thus clearing the flag. The CBI and SBI instructions work with registers \$00 to \$1F only.

### **Instruction Set Summary**

| Mnemonics      | Operands         | Description                              | Operation  | Flags          | #Clocks |

### **Ordering Information**

Note: 1. This device can also be supplied in wafer form. Please contact your local Atmel sales office for detailed ordering information and minimum quantities.

2. Pb-free packaging alternative, complies to the European Directive for Restriction of Hazardous Substances (RoHS directive). Also Halide free and fully Green.

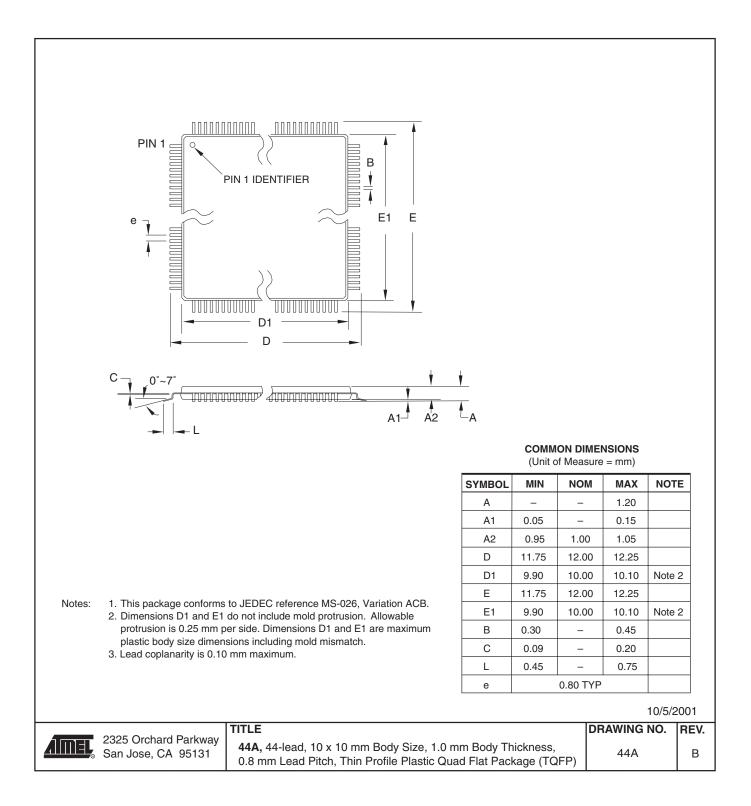

|             | Package Type  |
|-------------|---|
| 44 <b>A</b> | 44-lead, Thin (1.0 mm) Plastic Gull Wing Quad Flat Package (TQFP)                                     |
| 40P6        | 40-lead, 0.600" Wide, Plastic Dual Inline Package (PDIP)  |
| 44J         | 44-lead, Plastic J-Leaded Chip Carrier (PLCC)   |
| 44M1        | 44-pad, 7 x 7 x 1.0 mm body, lead pitch 0.50 mm, Quad Flat No-Lead/Micro Lead Frame Package (QFN/MLF) |

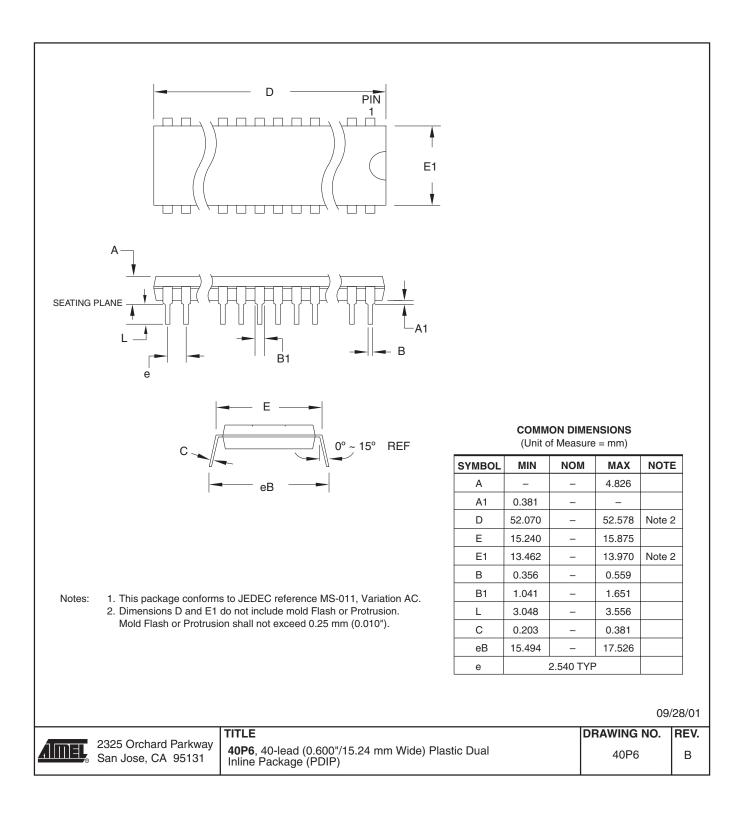

### **Packaging Information**

44A

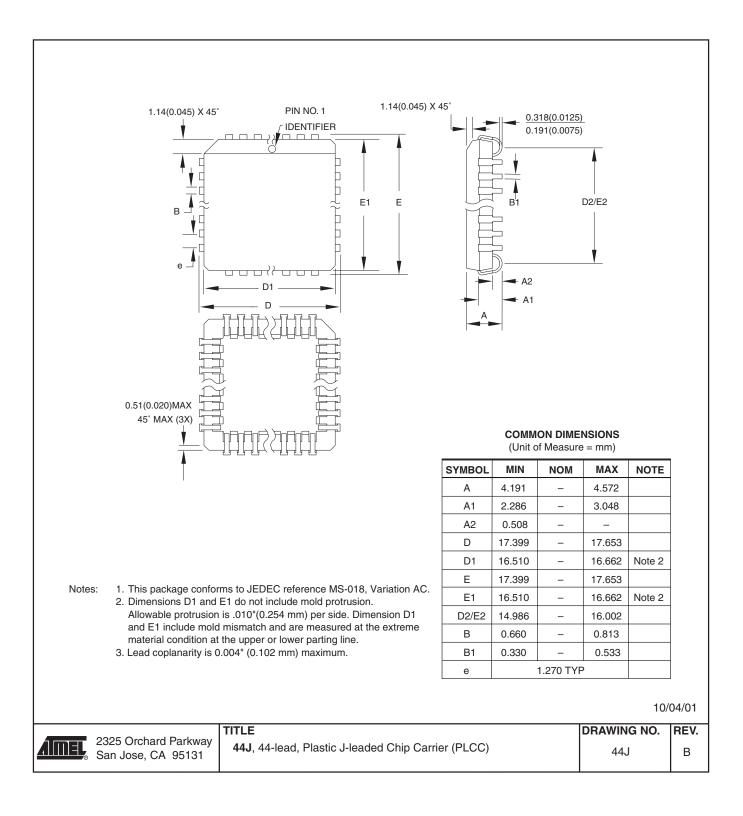

### 40P6

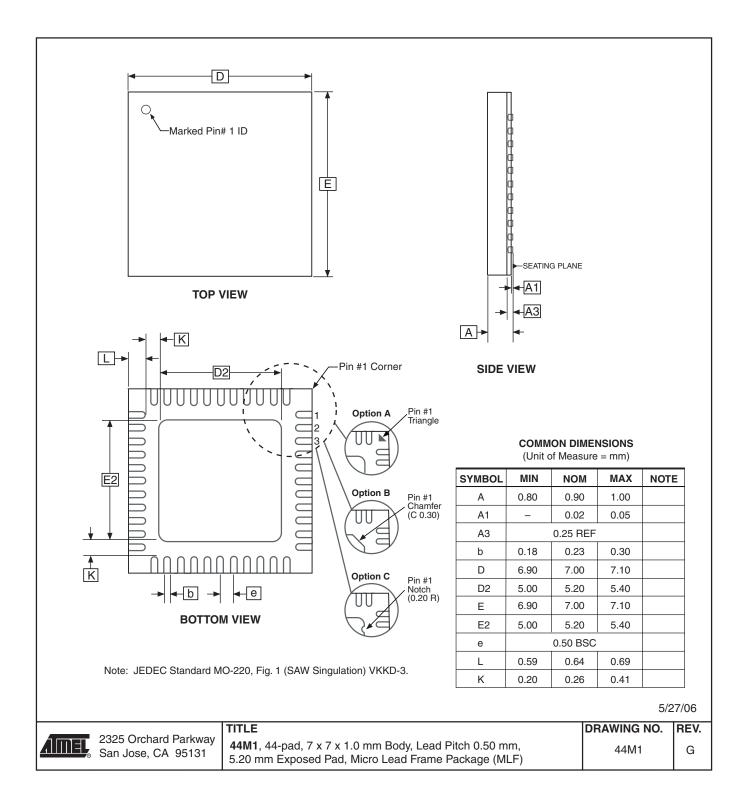

### 44M1

### Errata

ATmega8515(L) Rev. C and D The revision letter in this section refers to the revision of the ATmega8515 device.

### 1. First Analog Comparator conversion may be delayed

If the device is powered by a slow rising VCC, the first Analog Comparator conversion will take longer than expected on some devices.

### **Problem Fix/Workaround**

When the device has been powered or reset, disable then enable the Analog Comparator before the first conversion.

| Datasheet Revision<br>History | Please note that the referring page numbers in this section are referring to this docu-<br>ment. The referring revision in this section are referring to the document revision. |
|-------------------------------|---|
| Rev. 2512J-10/06              | 1. Updated TOP/BOTTOM description for all Timer/Counters Fast PWM mode.   |
|                               | 2. Updated "Errata" on page 18.   |
| Rev. 2512I-08/06              | 1. Updated "Ordering Information" on page 13.   |
| Rev. 2512H-04/06              | 1. Added "Resources" on page 6.   |
|                               | 2. Updated cross reference in "Phase Correct PWM Mode" on page 113.   |
|                               | 3. Updated "Timer/Counter Interrupt Mask Register – TIMSK(1)" on page 124.  |
|                               | 4. Updated "Serial Peripheral Interface – SPI" on page 126.   |
|                               | 5. Removed obsolete section of "Calibration Byte" on page 181.  |
|                               | 6. Updated Table 10 on page 38, Table 52 on page 120, Table 94 on page 196 and Table 96 on page 199.  |
| Rev. 2512G-03/05              | 1. MLF-package alternative changed to "Quad Flat No-Lead/Micro Lead Frame<br>Package QFN/MLF".  |
|                               | 2. Updated "Electrical Characteristics" on page 197   |
|                               | 3. Updated "Ordering Information" on page 13.   |
| Rev. 2512E-09/03              | 1. Updated "Calibrated Internal RC Oscillator" on page 39.  |
| Rev. 2512E-09/03              | 1. Removed "Preliminary" from the datasheet.  |
|                               | 2. Updated Table 18 on page 46 and "Absolute Maximum Ratings" and "DC Characteristics" in "Electrical Characteristics" on page 197.   |
|                               | 3. Updated chapter "ATmega8515 Typical Characteristics" on page 207.  |
| Rev. 2512D-02/03              | 1. Added "EEPROM Write During Power-down Sleep Mode" on page 23.  |
|                               | 2. Improved the description in "Phase Correct PWM Mode" on page 88.   |
|                               | 3. Corrected OCn waveforms in Figure 53 on page 111.  |
|                               | 4. Added note under "Filling the Temporary Buffer (page loading)" on page 173 about writing to the EEPROM during an SPM page load.  |
|                               | 5. Updated Table 93 on page 195.  |
|                               | 6 Undeted "Deckaging Information" on page 14  |

6. Updated "Packaging Information" on page 14.

- **Rev. 2512C-10/02** 1. Added "Using all Locations of External Memory Smaller than 64 KB" on page 31.
  - 2. Removed all TBD.
  - 3. Added description about calibration values for 2, 4, and 8 MHz.
  - 4. Added variation in frequency of "External Clock" on page 40.
  - 5. Added note about V<sub>BOT</sub>, Table 18 on page 46.
  - 6. Updated about "Unconnected pins" on page 64.
  - 7. Updated "16-bit Timer/Counter1" on page 97, Table 51 on page 119 and Table 52 on page 120.
  - 8. Updated "Enter Programming Mode" on page 184, "Chip Erase" on page 184, Figure 77 on page 187, and Figure 78 on page 188.
  - 9. Updated "Electrical Characteristics" on page 197, "External Clock Drive" on page 199, Table 96 on page 199 and Table 97 on page 200, "SPI Timing Characteristics" on page 200 and Table 98 on page 202.
  - 10. Added "Errata" on page 18.
- **Rev. 2512B-09/02** 1. Changed the Endurance on the Flash to 10,000 Write/Erase Cycles.
- Rev. 2512A-04/02 1. Initial.
