Welcome to E-XFL.COM

What is "Embedded - Microcontrollers"?

"Embedded - Microcontrollers" refer to small, integrated circuits designed to perform specific tasks within larger systems. These microcontrollers are essentially compact computers on a single chip, containing a processor core, memory, and programmable input/output peripherals. They are called "embedded" because they are embedded within electronic devices to control various functions, rather than serving as standalone computers. Microcontrollers are crucial in modern electronics, providing the intelligence and control needed for a wide range of applications.

Applications of "Embedded - Microcontrollers"

Details	
Product Status	Active
Core Processor	S12Z
Core Size	16-Bit
Speed	32MHz
Connectivity	I²C, IrDA, LINbus, SCI, SPI, UART/USART
Peripherals	LVD, POR, PWM, WDT
Number of I/O	19
Program Memory Size	32KB (32K x 8)
Program Memory Type	FLASH
EEPROM Size	128 x 8
RAM Size	1K x 8
Voltage - Supply (Vcc/Vdd)	5.5V ~ 18V
Data Converters	A/D 6x10b
Oscillator Type	Internal
Operating Temperature	-40°C ~ 85°C (TA)
Mounting Type	Surface Mount, Wettable Flank
Package / Case	32-VFQFN Exposed Pad
Supplier Device Package	32-HVQFN (5x5)
Purchase URL	https://www.e-xfl.com/product-detail/nxp-semiconductors/s9s12zvls3f0cfm

1.7.2.7 PJ[1:0] — Port P I/O Signals

PJ[1:0] are general-purpose input or output signals. They can have a pull-up or pull-down device selected and enabled on per signal basis. During and out of reset the pull devices are enabled.

1.7.2.8 PP[7:0] / KWP[7:0] — Port P I/O Signals

PP[7:0] are general-purpose input or output signals. The signals can be configured on per signal basis as interrupt inputs with wake-up capability (KWP[7:0]). They can have a pull-up or pull-down device selected and enabled on per signal basis. During and out of reset the pull devices are disabled.

1.7.2.9 PS[3:0] / KWS[3:0] — Port S I/O Signals

PS[3:0] are general-purpose input or output signals. The signals can be configured on per signal basis as interrupt inputs with wake-up capability (KWS[3:0]). They can have a pull-up or pull-down device selected and enabled on per signal basis. During and out of reset the pull-up devices are enabled.

1.7.2.10 PT[7:0] — Port T I/O Signals

PT[7:0] are general-purpose input or output signals. They can have a pull-up or pull-down device selected and enabled on per signal basis. During and out of reset the pull devices are disabled.

1.7.2.11 AN0[9:0] — ADC Input Signals

These are the analog inputs of the Analog-to-Digital Converters. ADC has 10 analog input channels connected to PAD port pins.

1.7.2.12 ACMP Signals

1.7.2.12.1 ACMP_0 / ACMP_1 — Analog Comparator Inputs

ACMP_0 and ACMP_1 are the inputs of the analog comparator ACMP.

1.7.2.12.2 ACMPO — Analog Comparator Output

ACMPO is the outputs of the analog comparators.

1.7.2.13 DAC Signals

1.7.2.13.1 AMP Output Pin

This analog pin is used for the buffered analog output voltage from the operational amplifier outputs, when the according mode is selected in DACCTL register bits DACM[2:0].

1.7.2.13.2 AMPP Input Pin

This analog input pin is used as input signal for the operational amplifier positive input pins when the according mode is selected in DACCTL register bits DACM[2:0].

1.12 Resets and Interrupts

1.12.1 Resets

Table 1-11. lists all reset sources and the vector locations. Resets are explained in detail in the Chapter 9, “S12 Clock, Reset and Power Management Unit (S12CPMU_UHV)”.

Table 1-11. Reset Sources and Vector Locations

Vector Address	Reset Source	CCR Mask	Local Enable
0xFFFFFC	Power-On Reset (POR)	None	None
	Low Voltage Reset (LVR)	None	None
	External pin $\overline{\text{RESET}}$	None	None
	Clock monitor reset	None	OSCE Bit in CPMUOSC and OMRE Bit in CPMUOSC2 register
	COP watchdog reset	None	CR[2:0] in CPMUCOP register

1.12.2 Interrupt Vectors

Table 1-12 lists all interrupt sources and vectors in the default order of priority. The interrupt module description provides an interrupt vector base register (IVBR) to relocate the vectors.

Table 1-12. Interrupt Vector Locations (Sheet 1 of 4)

Vector Address[1]	Interrupt Source	CCR Mask	Local Enable	Wake up from STOP	Wake up from WAIT
Vector base + 0x1F8	Unimplemented page1 op-code trap (SPARE)	None	None	-	-
Vector base + 0x1F4	Unimplemented page2 op-code trap (TRAP)	None	None	-	-
Vector base + 0x1F0	Software interrupt instruction (SWI)	None	None	-	-
Vector base + 0x1EC	System call interrupt instruction (SYS)	None	None	-	-
Vector base + 0x1E8	Machine exception	None	None	-	-
Vector base + 0x1E4	Reserved				
Vector base + 0x1E0	Reserved				
Vector base + 0x1DC	Spurious interrupt	—	None	-	-
Vector base + 0x1D8	$\overline{\text{XIRQ}}$ interrupt request	X bit	None	Yes	Yes
Vector base + 0x1D4	$\overline{\text{IRQ}}$ interrupt request	I bit	IRQCR(IRQEN)	Yes	Yes
Vector base + 0x1D0	RTI time-out interrupt	I bit	CPMUINT (RTIE)	**See CPMU section**	Yes

Chapter 4
Memory Mapping Control (S12ZMMCV1)

Table 4-1. Revision History

Revision Number	Revision Date	Sections Affected	Description of Changes
V01.06	12 Feb 2013	Figure 4-8 4.3.2.2/4-120	• Changed “KByte:to “KB” • Corrected the description of the MMCECH/L register •
V01.07	3 May 2013		• Fixed typos • Removed PTU references

4.1 Introduction

The S12ZDBG module controls the access to all internal memories and peripherals for the S12ZCPU, and the S12ZBDC module. It also provides dirct memory access for the ADC module. The S12ZDBG determines the address mapping of the on-chip resources, regulates access priorities and enforces memory protection. Figure 4-1 shows a block diagram of the S12ZDBG module.

5.4.11 Serial Communication Timeout

The host initiates a host-to-target serial transmission by generating a falling edge on the BKGD pin. If BKGD is kept low for more than 128 target clock cycles, the target understands that a SYNC command was issued. In this case, the target waits for a rising edge on BKGD in order to answer the SYNC request pulse. When the BDC detects the rising edge a soft reset is generated, whereby the current BDC command is discarded. If the rising edge is not detected, the target keeps waiting forever without any timeout limit.

If a falling edge is not detected by the target within 512 clock cycles since the last falling edge, a timeout occurs and the current command is discarded without affecting memory or the operating mode of the MCU. This is referred to as a soft-reset. This timeout also applies if 512 cycles elapse between 2 consecutive ERASE_FLASH commands. The soft reset is disabled whilst the internal flash mass erase operation is pending completion.

timeouts are also possible if a BDC command is partially issued, or data partially retrieved. Thus if a time greater than 512 BDCSI clock cycles is observed between two consecutive negative edges, a soft-reset occurs causing the partially received command or data retrieved to be discarded. The next negative edge at the BKGD pin, after a soft-reset has occurred, is considered by the target as the start of a new BDC command, or the start of a SYNC request pulse.

5.5 Application Information

5.5.1 Clock Frequency Considerations

Read commands without status and without ACK must consider the frequency relationship between BDCSI and the internal core clock. If the core clock is slow, then the internal access may not have been carried out within the standard 16 BDCSI cycle delay period (DLY). The host must then extend the DLY period or clock frequencies accordingly. Taking internal clock domain synchronizers into account, the minimum number of BDCSI periods required for the DLY is expressed by:

$$\#DLY > 3(f_{(BDCSI\ clock)} / f_{(core\ clock)}) + 4$$

and the minimum core clock frequency with respect to BDCSI clock frequency is expressed by

$$\text{Minimum } f_{(core\ clock)} = (3/(\#DLY \text{ cycles } -4))f_{(BDCSI\ clock)}$$

For the standard 16 period DLY this yields $f_{(core\ clock)} >= (1/4)f_{(BDCSI\ clock)}$

8.2.2.4 ECC Debug Pointer Register (ECCDPTRH, ECCDPTRM, ECCDPTRL)

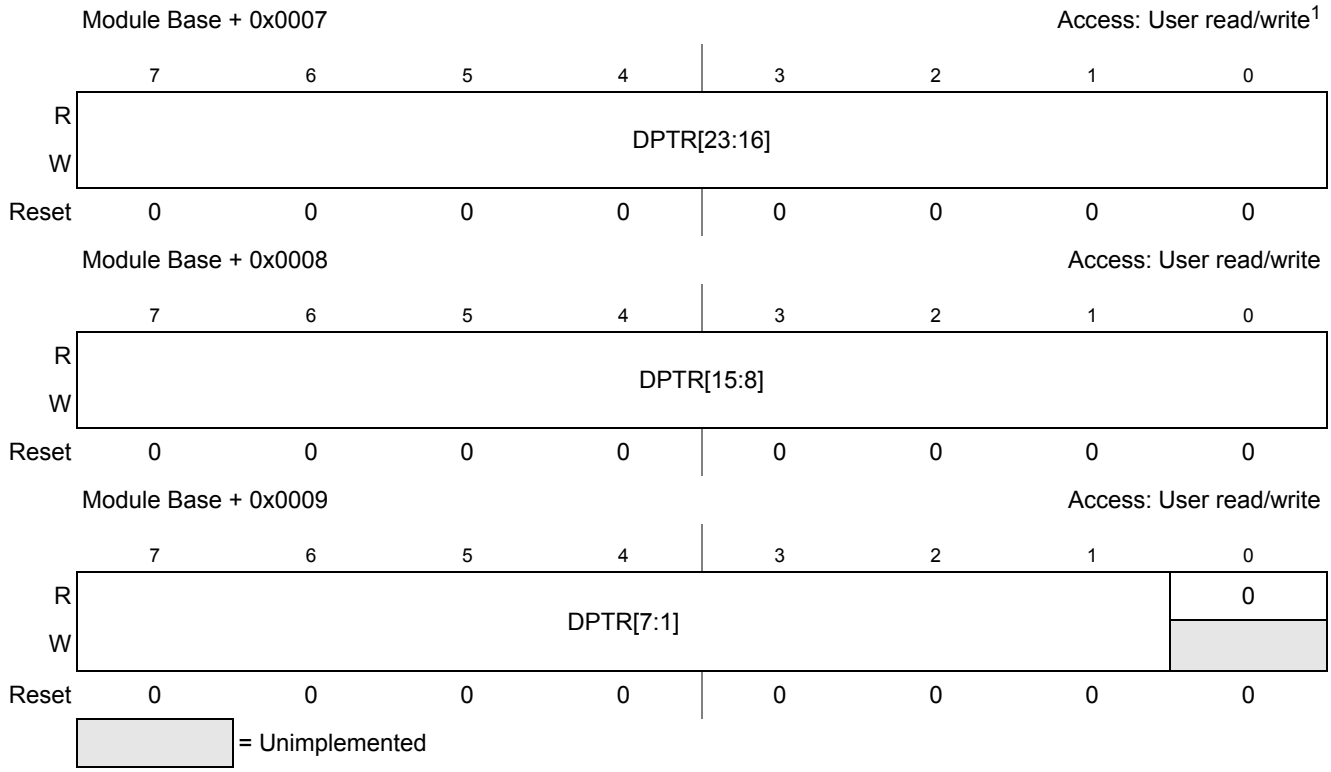

Figure 8-5. ECC Debug Pointer Register (ECCDPTRH, ECCDPTRM, ECCDPTRL)

1 Read: Anytime
Write: Anytime

Table 8-5. ECCDPTR Register Field Descriptions

Field	Description
DPTR [23:0]	**ECC Debug Pointer** — This register contains the system memory address which will be used for a debug access. Address bits not relevant for SRAM address space are not writeable, so the software should read back the pointer value to make sure the register contains the intended memory address. It is possible to write an address value to this register which points outside the system memory. There is no additional monitoring of the register content; therefore, the software must make sure that the address value points to the system memory space.

9.3 Memory Map and Registers

This section provides a detailed description of all registers accessible in the S12CPMU_UHV.

9.3.1 Module Memory Map

The S12CPMU_UHV registers are shown in Figure 9-3.

Address Offset	Register Name		Bit 7	6	5	4	3	2	1	Bit 0
0x0000	RESERVED	R	0	0	0	0	0	0	0	0

Write: Anytime

Table 9-25. CPMUHTTR Field Descriptions

Field	Description
7 HTOE	**High Temperature Offset Enable Bit** — If set the temperature sense offset is enabled. 0 The temperature sense offset is disabled. HTTR[3:0] bits don't care. 1 The temperature sense offset is enabled. HTTR[3:0] select the temperature offset.
3–0 HTTR[3:0]	**High Temperature Trimming Bits** — See Table 9-26 for trimming effects.

Table 9-26. Trimming Effect of HTTR

HTTR[3:0]	Temperature sensor voltage V_{HT}	Interrupt threshold temperatures T_{HTIA} and T_{HTID}
0000	lowest	highest
0001	increasing	decreasing
....		
1110		
1111	highest	lowest

Table 10-3. ADCCTL_0 Field Descriptions (continued)

Field	Description
11-10 ACC_CFG[1:0]	**ADCFLWCTL Register Access Configuration** — These bits define if the register ADCFLWCTL is controlled via internal interface only or data bus only or both. See Table 10-4. for more details.
9 STR_SEQA	**Control Of Conversion Result Storage and RSTAR_EIF flag setting at Sequence Abort or Restart Event** — This bit controls conversion result storage and RSTAR_EIF flag setting when a Sequence Abort Event or Restart Event occurs as follows: *If STR_SEQA = 1'b0 and if a:* • Sequence Abort Event or Restart Event is issued during a conversion the data of this conversion is not stored and the respective conversion complete flag is not set • Restart Event only is issued before the last conversion of a CSL is finished and no Sequence Abort Event is in process (SEQA clear) causes the RSTA_EIF error flag to be asserted and bit SEQA gets set by hardware *If STR_SEQA = 1'b1 and if a:* • Sequence Abort Event or Restart Event is issued during a conversion the data of this conversion is stored and the respective conversion complete flag is set and Intermediate Result Information Register is updated. • Restart Event only occurs during the last conversion of a CSL and no Sequence Abort Event is in process (SEQA clear) does not set the RSTA_EIF error flag • Restart Event only is issued before the CSL is finished and no Sequence Abort Event is in process (SEQA clear) causes the RSTA_EIF error flag to be asserted and bit SEQA gets set by hardware
8 MOD_CFG	**(Conversion Flow Control) Mode Configuration** — This bit defines the conversion flow control after a Restart Event and after execution of the "End Of List" command type: - Restart Mode - Trigger Mode (For more details please see also section Section 10.6.3.2, "Introduction of the Programmer's Model and following.) 0 "Restart Mode" selected. 1 "Trigger Mode" selected.

Table 10-4. ADCFLWCTL Register Access Configurations

ACC_CFG[1]	ACC_CFG[0]	ADCFLWCTL Access Mode
0	0	None of the access paths is enabled (default / reset configuration)
0	1	Single Access Mode - Internal Interface (ADCFLWCTL access via internal interface only)
1	0	Single Access Mode - Data Bus (ADCFLWCTL access via data bus only)
1	1	Dual Access Mode (ADCFLWCTL register access via internal interface and data bus)

NOTE

Each conversion flow control bit (SEQA, RSTA, TRIG, LDOK) must be controlled by software or internal interface according to the requirements described in Section 10.6.3.2.4, “The two conversion flow control Mode Configurations and overview summary in Table 10-11.

Figure 13-23. Receive/Transmit Message Buffer — Extended Identifier Mapping (continued)

Register Name	Bit 7	6	5	4	3	2	1	Bit0

= Unused, always read ‘x’

Read:

- For transmit buffers, anytime when TXEx flag is set (see Section 13.3.2.7, “MSCAN Transmitter Flag Register (CANTFLG)”) and the corresponding transmit buffer is selected in CANTBSEL (see Section 13.3.2.11, “MSCAN Transmit Buffer Selection Register (CANTBSEL)”).
- For receive buffers, only when RXF flag is set (see Section 13.3.2.5, “MSCAN Receiver Flag Register (CANRFLG)”).

Write:

- For transmit buffers, anytime when TXEx flag is set (see Section 13.3.2.7, “MSCAN Transmitter Flag Register (CANTFLG)”) and the corresponding transmit buffer is selected in CANTBSEL (see Section 13.3.2.11, “MSCAN Transmit Buffer Selection Register (CANTBSEL)”).
- Unimplemented for receive buffers.

Reset: Undefined because of RAM-based implementation

Figure 13-24. Receive/Transmit Message Buffer — Standard Identifier Mapping

7–0 CAE[7:0]	Center Aligned Output Modes on Channels 7–0 0 Channels 7–0 operate in left aligned output mode. 1 Channels 7–0 operate in center aligned output mode.

17.3.2.6 PWM Control Register (PWMCTL)

The PWMCTL register provides for various control of the PWM module.

Module Base + 0x0005

	7	6	5	4	3	2	1	0
R	CON67	CON45	CON23	CON01	PSWAI	PFRZ	0	0
W								
Reset	0	0	0	0	0	0	0	0

= Unimplemented or Reserved

Figure 17-8. PWM Control Register (PWMCTL)

Read: Anytime

Write: Anytime

There are up to four control bits for concatenation, each of which is used to concatenate a pair of PWM channels into one 16-bit channel. If the corresponding channels do not exist on a particular derivative, then writes to these bits have no effect and reads will return zeroes. When channels 6 and 7are concatenated, channel 6 registers become the high order bytes of the double byte channel. When channels 4 and 5 are concatenated, channel 4 registers become the high order bytes of the double byte channel. When channels 2 and 3 are concatenated, channel 2 registers become the high order bytes of the double byte channel. When channels 0 and 1 are concatenated, channel 0 registers become the high order bytes of the double byte channel.

See Section 17.4.2.7, “PWM 16-Bit Functions” for a more detailed description of the concatenation PWM Function.

NOTE

Change these bits only when both corresponding channels are disabled.

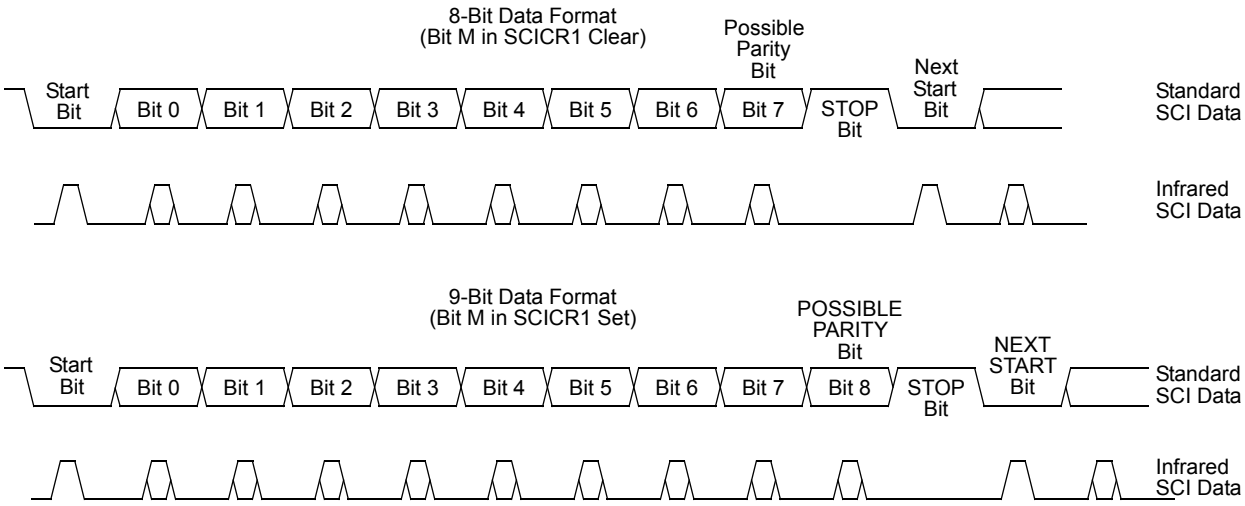

Figure 18-15. SCI Data Formats

Each data character is contained in a frame that includes a start bit, eight or nine data bits, and a stop bit. Clearing the M bit in SCI control register 1 configures the SCI for 8-bit data characters. A frame with eight data bits has a total of 10 bits. Setting the M bit configures the SCI for nine-bit data characters. A frame with nine data bits has a total of 11 bits.

Table 18-14. Example of 8-Bit Data Formats

Start Bit	Data Bits	Address Bits	Parity Bits	Stop Bit
1	8	0	0	1
1	7	0	1	1
1	7	1[1]	0	1

1 The address bit identifies the frame as an address character. See Section 18.4.6.6, “Receiver Wakeup”.

When the SCI is configured for 9-bit data characters, the ninth data bit is the T8 bit in SCI data register high (SCIDRH). It remains unchanged after transmission and can be used repeatedly without rewriting it. A frame with nine data bits has a total of 11 bits.

Table 18-15. Example of 9-Bit Data Formats

Start Bit	Data Bits	Address Bits	Parity Bits	Stop Bit
1	9	0	0	1
1	8	0	1	1
1	8	1[1]	0	1

1 The address bit identifies the frame as an address character. See Section 18.4.6.6, “Receiver Wakeup”.

Chapter 21
LIN Physical Layer (S12LINPHYV2)

Table 21-1. Revision History Table

Rev. No. (Item No.)	Date (Submitted By)	Sections Affected	Substantial Change(s)
V02.11	19 Sep 2013	All	- Removed preliminary note. - Fixed grammar and spelling throughout the document.
V02.12	20 Sep 2013	Standby Mode	- Clarified Standby mode behavior.
V02.13	8 Oct 2013	All	- More grammar, spelling, and formating fixes throughout the document.

21.1 Introduction

The LIN (Local Interconnect Network) bus pin provides a physical layer for single-wire communication in automotive applications. The LIN Physical Layer is designed to meet the LIN Physical Layer 2.2 specification from LIN consortium.

21.1.1 Features

The LIN Physical Layer module includes the following distinctive features:

- Compliant with LIN Physical Layer 2.2 specification.
- Compliant with the SAE J2602-2 LIN standard.
- Standby mode with glitch-filtered wake-up.
- Slew rate selection optimized for the baud rates: 10.4 kbit/s, 20 kbit/s and Fast Mode (up to 250 kbit/s).
- Switchable 34 kΩ/330 kΩ pullup resistors (in shutdown mode, 330 kΩ only)
- Current limitation for LIN Bus pin falling edge.
- Overcurrent protection.
- LIN TxD-dominant timeout feature monitoring the LPTxD signal.
- Automatic transmitter shutdown in case of an overcurrent or TxD-dominant timeout.
- Fulfills the OEM “Hardware Requirements for LIN (CAN and FlexRay) Interfaces in Automotive Applications” v1.3.

The LIN transmitter is a low-side MOSFET with current limitation and overcurrent transmitter shutdown. A selectable internal pullup resistor with a serial diode structure is integrated, so no external pullup components are required for the application in a slave node. To be used as a master node, an external

Chapter 22
Flash Module (S12ZFTMRZ)

Table 22-1. Revision History

Revision Number	Revision Date	Sections Affected	Description of Changes
V02.03	12 Apr 2012	22.3/22-618	Corrected many typo. Changed caution note
V02.04	17 May 2012	22.3.2.6/22-631	- Removed flag DFDIE
V02.05	11 Jul 2012		- Added explanation about when MGSTAT[1:0] bits are cleared, Section 22.3.2.7 - Added note about possibility of reading P-Flash and EEPROM simultaneously, Section 22.4.6
V02.06	18 Mar 2013		- Standardized nomenclature in references to memory sizes
V02.07	24 May 2013		- Revised references to NVM Resource Area to improve readability
V02.8	12 Jun 2013		- Changed MLOADU Section 22.4.7.12 and MLOADF Section 22.4.7.13 **FCCOB1 to FCCOB2**
V02.9	15 Oct 2014		Created memory-size independent version of this module description

22.1 Introduction

The P-Flash (Program Flash) and EEPROM memory sizes are specified at device level (Reference Manual device overview chapter). The description in the following sections is valid for all P-Flash and EEPROM memory sizes.

The Flash memory is ideal for single-supply applications allowing for field reprogramming without requiring external high voltage sources for program or erase operations. The Flash module includes a memory controller that executes commands to modify Flash memory contents. The user interface to the memory controller consists of the indexed Flash Common Command Object (FCCOB) register which is written to with the command, global address, data, and any required command parameters. The memory controller must complete the execution of a command before the FCCOB register can be written to with a new command.

CAUTION

A Flash word or phrase must be in the erased state before being programmed. Cumulative programming of bits within a Flash word or phrase is not allowed.

The Flash memory may be read as bytes and aligned words. Read access time is one bus cycle for bytes and aligned words. For misaligned words access, the CPU has to perform twice the byte read access command. For Flash memory, an erased bit reads 1 and a programmed bit reads 0.

22.4.5.3 Valid Flash Module Commands

Table 22-28 present the valid Flash commands, as enabled by the combination of the functional MCU mode (Normal SingleChip NS, Special Singlechip SS) with the MCU security state (Unsecured, Secured).

Table 22-28. Flash Commands by Mode and Security State

FCMD	Command	Unsecured		Secured	
		NS[1]	SS[2]	NS[3]	SS[4]
