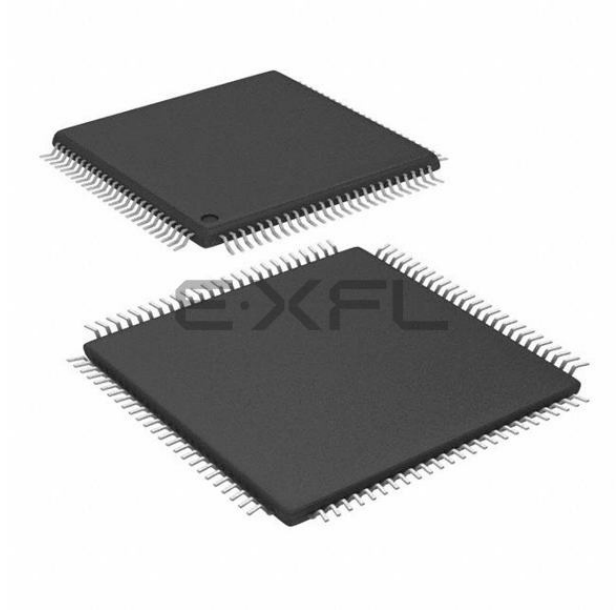
Microchip Technology - PIC24EP512GU810-E/PT Datasheet



Welcome to E-XFL.COM

What is "Embedded - Microcontrollers"?

"Embedded - Microcontrollers" refer to small, integrated circuits designed to perform specific tasks within larger systems. These microcontrollers are essentially compact computers on a single chip, containing a processor core, memory, and programmable input/output peripherals. They are called "embedded" because they are embedded within electronic devices to control various functions, rather than serving as standalone computers. Microcontrollers are crucial in modern electronics, providing the intelligence and control needed for a wide range of applications.

Applications of "Embedded - Microcontrollers"

Details	
Product Status	Active
Core Processor	PIC
Core Size	16-Bit
Speed	60 MIPs
Connectivity	CANbus, I²C, IrDA, LINbus, SPI, UART/USART, USB OTG
Peripherals	Brown-out Detect/Reset, DMA, POR, PWM, WDT
Number of I/O	83
Program Memory Size	512KB (170K x 24)
Program Memory Type	FLASH
EEPROM Size	-
RAM Size	24K x 16
Voltage - Supply (Vcc/Vdd)	3V ~ 3.6V
Data Converters	A/D 32x10b/12b
Oscillator Type	Internal
Operating Temperature	-40°C ~ 125°C (TA)
Mounting Type	Surface Mount
Package / Case	100-TQFP
Supplier Device Package	100-TQFP (12x12)

4.8 Interfacing Program and Data Memory Spaces

The dsPIC33EPXXX(GP/MC/MU)806/810/814 and PIC24EPXXX(GP/GU)810/814 architecture uses a 24-bit wide Program Space and a 16-bit wide data space. The architecture is also a modified Harvard scheme, meaning that data can also be present in the Program Space. To use this data successfully, it must be accessed in a way that preserves the alignment of information in both spaces.

Aside from normal execution, the dsPIC33EPXXX(GP/MC/MU)806/810/814 and PIC24EPXXX(GP/GU)810/814 architecture provides two methods by which Program Space can be accessed during operation:

- Using table instructions to access individual bytes or words anywhere in the Program Space
- Remapping a portion of the Program Space into the data space (Program Space Visibility)

Table instructions allow an application to read or write to small areas of the program memory. This capability makes the method ideal for accessing data tables that need to be updated periodically. It also allows access to all bytes of the program word. The remapping method allows an application to access a large block of data on a read-only basis, which is ideal for look-ups from a large table of static data. The application can only access the least significant word of the program word.

TABLE 4-77: PROGRAM SPACE ADDRESS CONSTRUCTION

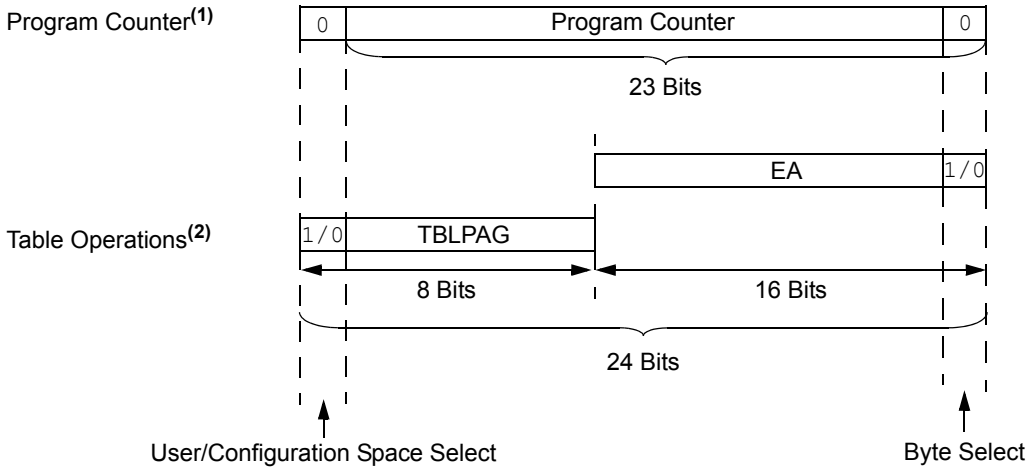
FIGURE 4-12: DATA ACCESS FROM PROGRAM SPACE ADDRESS GENERATION



Note 1: The Least Significant bit (LSb) of Program Space addresses is always fixed as '0' to maintain word alignment of data in the program and data spaces.

2: Table operations are not required to be word-aligned. Table read operations are permitted in the configuration memory space.

22.0 USB ON-THE-GO (OTG) MODULE (dsPIC33EPXXXMU8XX AND PIC24EPGU8XX DEVICES ONLY)

Note 1: This data sheet is not intended to be a comprehensive reference source. To complement the information in this data sheet, refer to **Section 25. "USB On-The-Go (OTG)"** (DS70571) of the "*dsPIC33E/PIC24E Family Reference Manual*", which is available from the Microchip web site (www.microchip.com).

2: Some registers and associated bits described in this section may not be available on all devices. Refer to **Section 4.0 "Memory Organization"** in this data sheet for device-specific register and bit information.

22.1 Overview

The Universal Serial Bus (USB) On-The-Go (OTG) module includes the following features:

- USB Full-Speed Support for Host and Device
- Low-Speed Host Support
- USB On-The-Go Support
- Integrated Signaling Resistors
- Integrated Analog Comparators for VBUS Monitoring
- Integrated USB Transceiver
- Hardware Performs Transaction Handshaking
- Endpoint Buffering Anywhere in System RAM
- Integrated DMA Controller to Access System RAM
- Support for all four transfer types:
  - Control
  - Interrupt
  - Bulk Data
  - Isochronous
- Queueing of up to Four Endpoint Transfers without Servicing
- USB 5V Charge Pump Controller

The USB module contains the analog and digital components to provide a USB 2.0 full-speed and low-speed embedded host, full-speed device or OTG implementation with a minimum of external components.

The USB module consists of the clock generator, the USB voltage comparators, the transceiver, the Serial Interface Engine (SIE), pull-up and pull-down resistors, and the register interface. Figure 22-1 illustrates the block diagram of the USB OTG module.

The device auxiliary clock generator provides the 48 MHz clock required for USB communication. The voltage comparators monitor the voltage on the VBUS pin to determine the state of the bus. The transceiver provides the analog translation between the USB bus and the digital logic. The SIE is a state machine that transfers data to and from the endpoint buffers and generates the protocol for data transfers. The integrated pull-up and pull-down resistors eliminate the need for external signaling components. The register interface allows the CPU to configure and communicate with the module.

Note: The implementation and use of the USB specifications and other third party specifications or technology may require a license from various entities, including, but not limited to USB Implementers Forum, Inc. (also referred to as USB-IF). It is your responsibility to obtain more information regarding any applicable licensing obligations.

22.2 Clearing USB OTG Interrupts

Unlike device level interrupts, the USB OTG interrupt status flags are not freely writable in software. All USB OTG flag bits are implemented as hardware set-only bits. Additionally, these bits can only be cleared in software by writing a '1' to their locations (i.e., performing a BSET instruction). Writing a '0' to a flag bit (i.e., a BCLR instruction) has no effect.

Note: Throughout this section, a bit that can only be cleared by writing a '1' to its location is referred to as "Write '1' to clear bit". In register descriptions, this function is indicated by the descriptor, "K".

bit 15-0 **TSE<15:0>:** Transmit Slot Enable Control bits

1 = Transmit buffer contents are sent during the individual time slot n

0 = CSDO pin is tri-stated or driven to logic ‘0’ during the individual time slot, depending on the state of the CSDOM bit

25.0 COMPARATOR MODULE

Note 1: This data sheet summarizes the features of the dsPIC33EPXXX(GP/MC/MU)806/810/814 and PIC24EPXXX(GP/GU)810/814 families of devices. It is not intended to be a comprehensive reference source. To complement the information in this data sheet, refer to **Section 26. "Op Amp/Comparator"** (DS70357) of the "*dsPIC33E/PIC24E Family Reference Manual*", which is available from the Microchip web site (www.microchip.com).

2: Some registers and associated bits described in this section may not be available on all devices. Refer to **Section 4.0 "Memory Organization"** in this data sheet for device-specific register and bit information.

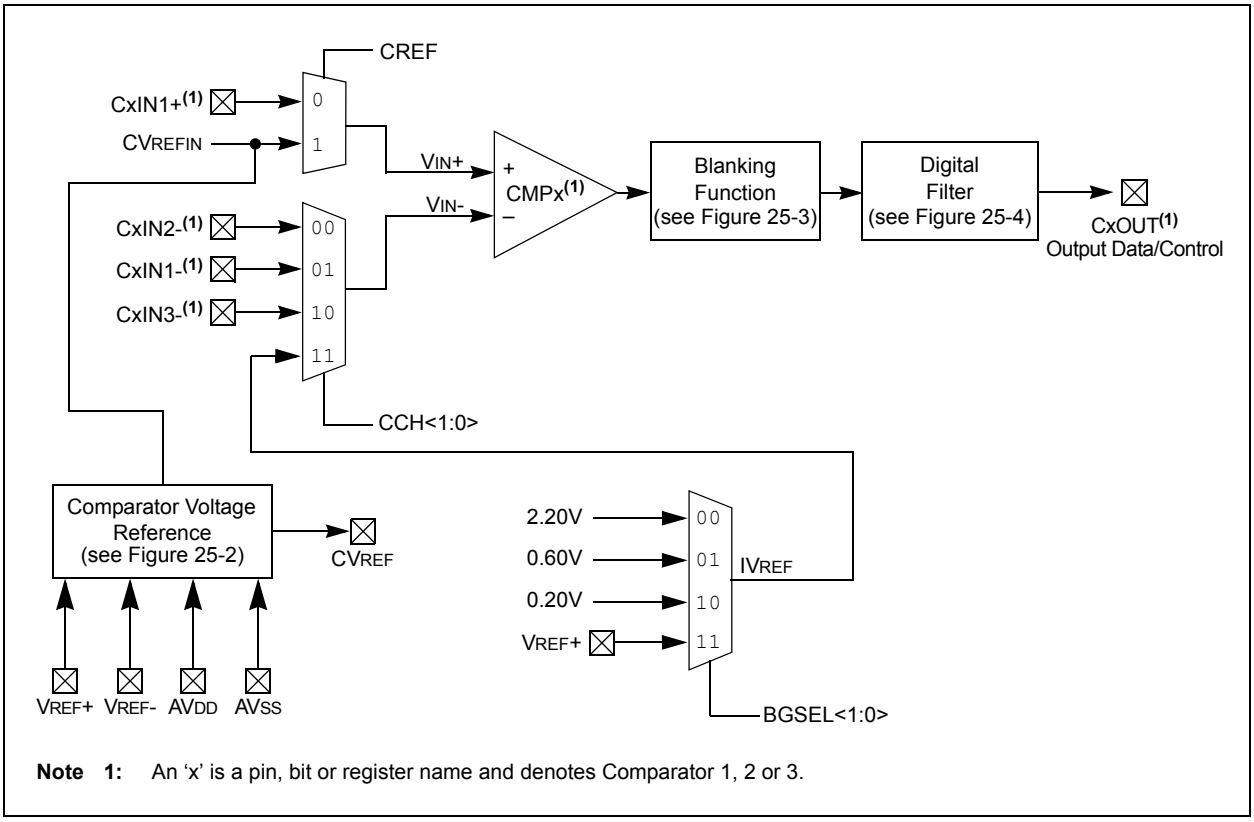
The comparator module provides three comparators that can be configured in different ways. As shown in Figure 25-1, individual comparator options are specified by the comparator module's Special Function Register (SFR) control bits.

These options allow users to:

- Select the edge for trigger and interrupt generation
- Configure the comparator voltage reference and band gap
- Configure output blanking and masking

The comparator operating mode is determined by the input selections (i.e., whether the input voltage is compared to a second input voltage or to an internal voltage reference).

FIGURE 25-1: COMPARATOR I/O OPERATING MODES



Note 1: An 'x' is a pin, bit or register name and denotes Comparator 1, 2 or 3.

Note 1: This instruction is available in dsPIC33EPXXX(GP/MC/MU)806/810/814 devices only.

2: Read and Read-Modify-Write (e.g., bit operations and logical operations) on non-CPU SFRs incur an additional instruction cycle.

TABLE A-1: MAJOR SECTION UPDATES (CONTINUED)

Section Name	Update Description
Section 17.0 "Quadrature Encoder Interface (QEI) Module (dsPIC33EPXXXMU806/810/814 Devices Only)"	Reordered the bit values for the OUTFNC<1:0> bits and updated the default POR bit value to 'x' for the HOME, INDEX, QEB, and QEA bits in the QEI I/O Control Register (see Register 17-2).
Section 23.0 "10-bit/12-bit Analog-to-Digital Converter (ADC)"	Updated VREFL in the ADC1 and ADC2 Module Block Diagram (see Figure 23-1).
Section 25.0 "Comparator Module"	Added Note 1 to the Comparator I/O Operating Modes (see Figure 25-1). Removed the CLPWR bit (CMxCON<12>) (see Register 25-2).
Section 29.0 "Special Features"	Added a new first paragraph to **Section 29.1 "Configuration Bits"**
Section 30.0 "Instruction Set Summary"	The following instructions have been updated (see Table 30-2): • BRA • CALL • CPBEQ • CPBGT • CPBLT • CPBNE • GOTO • MOVPAG • MUL • RCALL • RETFIE • RETLW • RETURN • TBLRDH • TBLRDL
Section 32.0 "Electrical Characteristics"	Updated the Typical and Maximum values for DC Characteristics: Operating Current (IDD) (see Table 32-5). Updated the Typical and Maximum values for DC Characteristics: Idle Current (IIDLE) (see Table 32-6). Updated the Maximum values for DC Characteristics: Power-down Current (IPD) (see Table 32-7). Updated the Maximum values for DC Characteristics: Doze Current (IDOZE) (see Table 32-8). Updated the parameter numbers for Internal FRC Accuracy (see Table 32-19). Updated the parameter numbers and the Typical value for parameter F21b for Internal RC Accuracy (see Table 32-20). Updated the Minimum value for PM6 and the Typical and Maximum values for PM7 in Parallel Master Port Read Requirements (see Table 32-52). Added DMA Module Timing Requirements (see Table 32-54).
