## Understanding [Embedded - CPLDs \(Complex Programmable Logic Devices\)](#)

Embedded - CPLDs, or Complex Programmable Logic Devices, are highly versatile digital logic devices used in electronic systems. These programmable components are designed to perform complex logical operations and can be customized for specific applications. Unlike fixed-function ICs, CPLDs offer the flexibility to reprogram their configuration, making them an ideal choice for various embedded systems. They consist of a set of logic gates and programmable interconnects, allowing designers to implement complex logic circuits without needing custom hardware.

### Macrocell

The 32 registered macrocells in the MFB are driven by the 32 outputs from the PTSA or the PTSA bypass. Each macrocell contains a programmable XOR gate, a programmable register/latch flip-flop and the necessary clocks and control logic to allow combinatorial or registered operation. All macrocells have an output that feeds the GRP. Selected macrocells have an additional output that feeds the OSA and hence I/Os. This dual or concurrent output capability from the macrocell gives efficient use of the hardware resources. One output can be a registered function for example, while the other output can be an unrelated combinatorial function. A direct register input from the I/O cell facilitates efficient use of the macrocell to construct high-speed input registers. Macrocell registers can be clocked from one of several global or product term clocks available on the device. A global and product term clock enable is also provided, eliminating the need to gate the clock to the macrocell registers directly. Reset and preset for the macrocell register is provided from both global and product term signals. The macrocell register can be programmed to operate as a D-type register or a D-type latch. Figure 8 is a graphical representation of the macrocell.

Figure 8. Macrocell

### Memory Modes

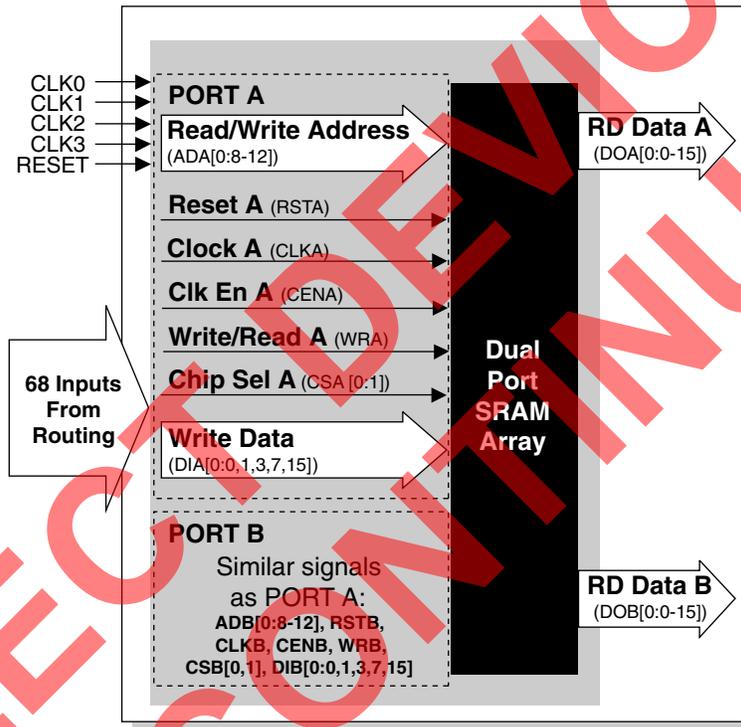

The ispXPLD 5000MX architecture allows the MFB to be configured as a variety of memory blocks as detailed in Table 4. The remainder of this section details operation of each of the memory modes. Additional information regarding the memory modes can also be found in TN1030, [Using Memory in ispXPLD 5000MX Devices](#).

**True Dual-Port SRAM Mode**

In Dual-Port SRAM Mode the multi-function array is configured as a dual port SRAM. In this mode two independent read/write ports access the same 8,192-bits of memory. Data widths of 1, 2, 4, 8, and 16 are supported by the MFB. Figure 9 shows the block diagram of the dual port SRAM.

Write data, address, chip select and read/write signals are always synchronous (registered.) The output data signals can be synchronous or asynchronous. Resets are asynchronous. All inputs on the same port share the same clock, clock enable, and reset selections. All outputs on the same port share the same clock, clock enable, and reset selections. Selections may be made independently between both inputs and outputs and ports. Table 5 shows the possible sources for the clock, clock enable and initialization signals for the various registers.

**Figure 9. Dual-Port SRAM Block Diagram**

**Table 5. Register Clock, Clock Enable, and Reset in Dual-Port SRAM Mode**

Register	Input	Source
Address, Write Data, Read Data, Read/Write, and Chip Select	Clock	CLKA (CLKB) or one of the global clocks (CLK0 - CLK3). The selected signal can be inverted if desired.
	Clock Enable	CENA (CENB) or one of the global clocks (CLK1 - CLK 2). The selected signal can be inverted if required.
	Reset	Created by the logical OR of the global reset signal and RSTA (RSTB). RSTA (RSTB) can be inverted is desired.

## Output Sharing Array (OSA)

A number of I/O pads are available in each sysIO bank to route the selected number of macrocells from the MFB outputs directly to the I/O pads in logic mode. In the ispXPLD 5000MX, the large number of inputs and PTs to the MFB as well as the presence of the PTSA can cover most routing flexibility of signals to I/O cells. The Output Sharing Array gives additional routing capability and I/O access to an MFB when a wide output function takes up the whole MFB and cannot be easily divided across multiple MFBs. By using the OSA, the wide output function, such as 32-bit FIFO, can have all of its output signals from the one MFB routed to I/O cells. In a given I/O block, the wide output functions must share the I/O pads with other logic functions.

The OSA bypass option routes the MFB signal directly to the I/O cell, allowing a direct connection to the I/O cell. The logic functions use the option to provide faster speed to the outputs. The Logic Signal Connection tables list the OSA bypass as the primary macrocell and OSA options as alternate macrocells. Similarly, the Alternate Input listing in the table shows the alternate macrocell input connection for a given I/O pin. Figure 17 shows the alternate macrocell connections in an I/O cell.

## sysIO Banks

The ispXPLD 5000MX devices are divided into four sysIO banks, consisting of multiple I/O cells, where each bank is capable of supporting 16 different I/O standards. Each sysIO bank has its own I/O voltage ( $V_{CCO}$ ) and reference voltage ( $V_{REF}$ ) resources allowing complete independence from the others.

## I/O Cell

The I/O cell of the ispXPLD 5000MX devices contains an output enable (OE) MUX, a programmable tri-state output buffer, a programmable input buffer, and programmable bus-maintenance circuitry.

The I/O cell receives inputs from its associated macrocells and the device pin. The I/O cell has a feedback line to its associated macrocells and a direct path to GRP. The output enable (OE) MUX selects the OE signal per I/O cell. The inputs to the OE MUX are the four global PTOE signals, PTOE and the two GOE signals. The OE MUX also has the ability to choose either the true or inverse of each of these signals. The output of the OE MUX goes through a logical AND with the TOE signal to allow easy tri-stating of the outputs for testing purposes. The MFBs are grouped into segments of four for the purpose of generating Shared PTOE signals. Each Shared PTOE signal is derived from PT 163 from one of the four MFBs. Table 10 shows the segments. The PTOE signal is derived from the first product term in each macrocell cluster, which is directly routed to the OE MUX. Therefore, every I/O cell can have a different OE signal. Figure 17 is a graphical representation of the I/O cell.

**sysIO Standards**

Each I/O within a bank is individually configurable based on the  $V_{CCO}$  and  $V_{REF}$  settings. Some standards also require the use of an external termination voltage. Table 12 lists the sysIO standards with the typical values for  $V_{CCO}$ ,  $V_{REF}$  and  $V_{TT}$ . For more information on the sysIO capability, refer to TN1000, [sysIO Usage Guidelines for Lattice Devices](#).

## Power Estimation Equations

$$ICC = ICC\_DC + IMFB\_CPLD + IMFB\_SRAM/PDPRAM/FIFO + IMFB\_DPRAM + IMFB\_CAM + IPLL\_D$$

### ICC\_DC

Use the appropriate value for 5000MC (1.8V power supply) or 5000MV/B (2.5V/3.3V power supply) from the data sheet.

### IMFB\_CPLD

$$= ((K0 * CPLD \text{ MFB inputs} + K1 * CPLD \text{ Logical Product Terms} + K2 * CPLD \text{ GRP from MFB} + K3 * CPLD \text{ GRP from IFB}) * AF + K4) * \text{FREQ} / 1000\mu\text{A/mA}$$

### IMFB\_CAM

$$= \text{CAM Memory MFBs} * ((\text{FREQ} * K8) + K9) \text{ (CAM operating in typical mode)}$$

### IMFB\_SRAM/PDPRAM/FIFO

$$= (\text{WR\_PERCENT} * (K1 + \text{WR\_PERCENT} * 8 * K0 + K10 + K11) + \text{RD\_PERCENT} * (K1 + 128 * \text{RD\_PERCENT} * K0 + 8 * \text{OSW\_PERCENT} * K2)) * \text{SRAM/PDPRAM/FIFO Memory MFBs} * \text{FREQ} / 1000\mu\text{A/mA}$$

### IMFB\_DPRAM

$$= (\text{WR\_PERCENT} * (2 * K1 + 2 * \text{WR\_PERCENT} * 8 * K0 + K10 + K11) + \text{RD\_PERCENT} * (2 * K1 + 2 * 128 * \text{RD\_PERCENT} * K0 + 8 * \text{OSW\_PERCENT} * K2)) * \text{DPRAM Memory MFBs} * \text{FREQ} / 1000\mu\text{A/mA}$$

### IPLL\_D

$$= K5 * \text{PLL\_FREQ} * \text{number of PLLs used. IPLL\_D is the PLL digital component of the VCC supply current.}$$

Analog portion of PLL supply current consumption, from PLL power pin:

$$IPLL\_A = (K6 * \text{PLL\_FREQ} + K7) * \text{number of PLLs used}$$

Notes:

- ICC = Current consumption of VCC power supply (mA)
- ICC-DC = ICC DC component – Current consumption at 0Mhz (mA)
- IMFB\_CPLD = CPLD (non-memory logic) current consumption (mA)
- IMFB\_SRAM/PDPRAM/FIFO = Current consumption for SRAM, PDPRAM, and FIFO (mA)
- IMFB\_DPRAM = Current consumption for DPRAM (mA)
- IMFB\_CAM = Current consumption for CAM (mA)
- IPLL\_D = PLL Current consumption of digital VCC power supply (mA)
- IPLL\_A = PLL analog power pin current consumption (VCCP pin)

### Part Number Description

### Ordering Information

Note: For voltage families offered in industrial temperature grades and for all but the slowest commercial speed grade, the speed grades on these devices are dual marked. For example, the commercial speed grade -45XXXXC is also marked with the industrial grade -75I. The commercial grade is always one speed grade faster than the associated dual mark industrial grade. The slowest commercial speed grade is marked as commercial grade only. In addition, the fastest commercial speed grade (-5) for the LC5768MB/MV devices, at Lattice's discretion, will utilize either a commercial grade only single-mark or a dual-mark format in conjunction with the slower industrial speed grade (-75).
