[Understanding Embedded - CPLDs \(Complex Programmable Logic Devices\)](#)

Embedded - CPLDs, or Complex Programmable Logic Devices, are highly versatile digital logic devices used in electronic systems. These programmable components are designed to perform complex logical operations and can be customized for specific applications. Unlike fixed-function ICs, CPLDs offer the flexibility to reprogram their configuration, making them an ideal choice for various embedded systems. They consist of a set of logic gates and programmable interconnects, allowing designers to implement complex logic circuits without needing custom hardware.

Applications of Embedded - CPLDs

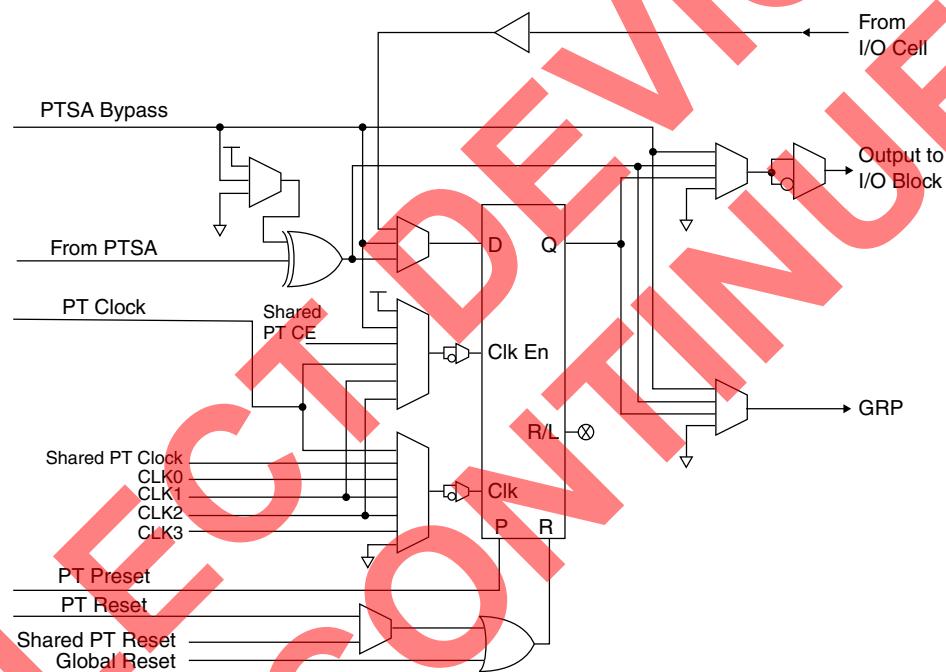

Details

Product Status	Obsolete
Programmable Type	In System Programmable
Delay Time tpd(1) Max	5 ns
Voltage Supply - Internal	2.3V ~ 2.7V
Number of Logic Elements/Blocks	8
Number of Macrocells	256
Number of Gates	-
Number of I/O	141
Operating Temperature	-40°C ~ 105°C (TJ)
Mounting Type	Surface Mount
Package / Case	256-BGA
Supplier Device Package	256-FPBGA (17x17)

Macrocell

The 32 registered macrocells in the MFB are driven by the 32 outputs from the PTSA or the PTSA bypass. Each macrocell contains a programmable XOR gate, a programmable register/latch flip-flop and the necessary clocks and control logic to allow combinatorial or registered operation. All macrocells have an output that feeds the GRP. Selected macrocells have an additional output that feeds the OSA and hence I/Os. This dual or concurrent output capability from the macrocell gives efficient use of the hardware resources. One output can be a registered function for example, while the other output can be an unrelated combinatorial function. A direct register input from the I/O cell facilitates efficient use of the macrocell to construct high-speed input registers. Macrocell registers can be clocked from one of several global or product term clocks available on the device. A global and product term clock enable is also provided, eliminating the need to gate the clock to the macrocell registers directly. Reset and preset for the macrocell register is provided from both global and product term signals. The macrocell register can be programmed to operate as a D-type register or a D-type latch. Figure 8 is a graphical representation of the macrocell.

Memory Modes

The ispXPLD 5000MX architecture allows the MFB to be configured as a variety of memory blocks as detailed in Table 4. The remainder of this section details operation of each of the memory modes. Additional information regarding the memory modes can also be found in TN1030, [Using Memory in ispXPLD 5000MX Devices](#).

FIFO Mode

In FIFO Mode the multi-function array is configured as a FIFO (First In First Out) buffer with built in control. The read and write clocks can be different or the same dependent on the application. Four flags show the status of the FIFO; Full, Empty, Almost Full, and Almost Empty. The thresholds for Full, Almost full and Almost empty are programmable by the user. It is possible to reset the read pointer, allowing support of frame retransmit in communications applications. If desired, the block can be used in show ahead mode allowing the early reading of the next read address.

In this mode one port accesses 16,384-bits of memory. Data widths of 1, 2, 4, 8, 16 and 32 are supported by the MFB. Figure 12 shows the block diagram of the FIFO.

Write data, write enable, flag outputs and read enable are synchronous. The Write Data, Almost Full and Full share the same clock and clock enables. Read outputs are synchronous although these can be configured in look ahead mode. The Read Data, Empty and Almost Empty signals share the same clock and clock enables. Reset is shared by all signals. Table 8 shows the possible sources for the clock, clock enable and reset signals for the various registers.

Figure 12. FIFO Block Diagram

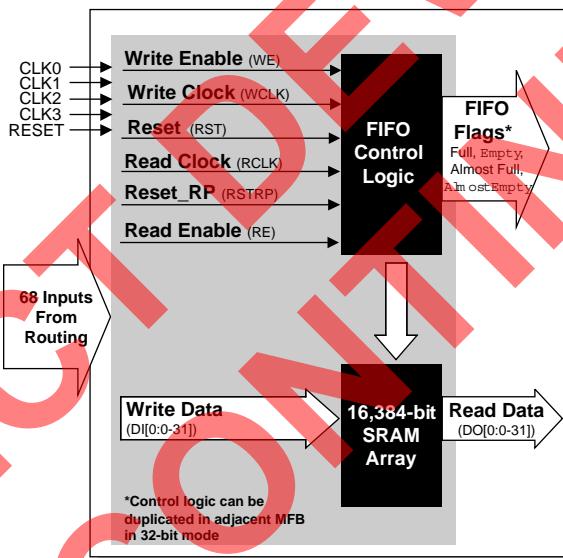

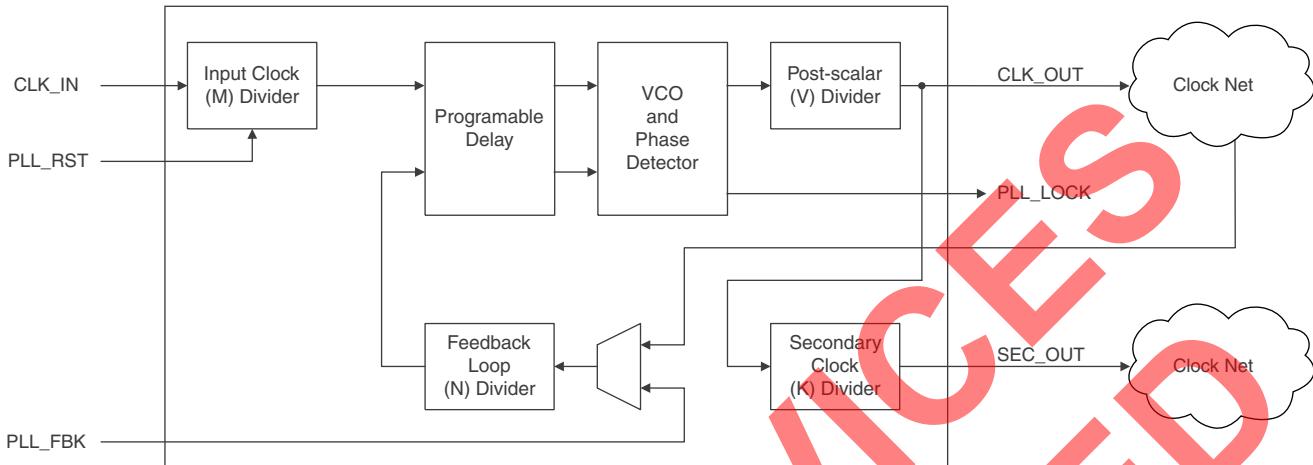

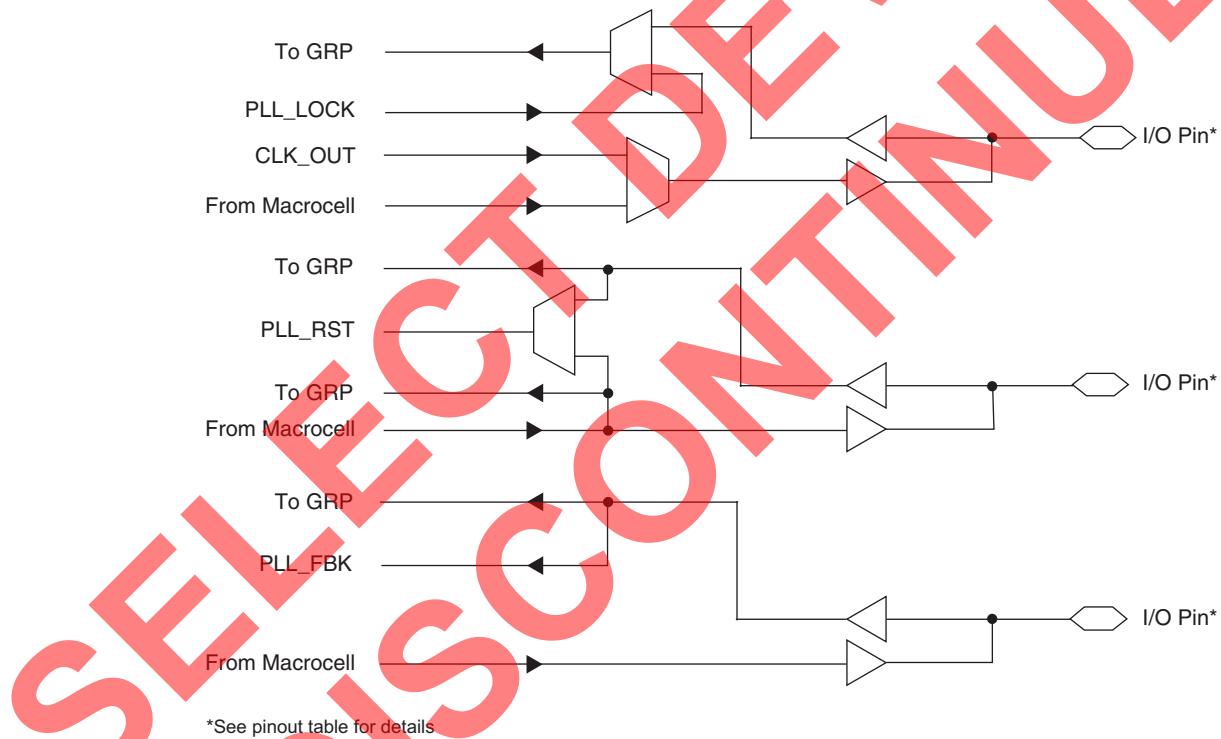

Table 8. Register Clocks, Clock Enables, and Initialization in FIFO Mode

Register	Input	Source
Write Data, Write Enable	Clock	WCLK or one of the global clocks (CLK0 - CLK3). Each of these signals can be inverted if required.
	Clock Enable	WE or one of the global clocks (CLK1 - CLK 2). Each of these signals can be inverted if required.
	Reset	N/A
Full and Almost Full Flags	Clock	WCLK or one of the global clocks (CLK0 - CLK3). Each of these signals can be inverted if required.
	Clock Enable	WE or one of the global clocks (CLK1 - CLK 2). Each of these signals can be inverted if required.
	Reset	Created by the logical OR of the global reset signal and RST. RST is routed by the multifunction array from GRP, with inversion if desired.
Read Data, Empty and Almost Empty Flags	Clock	RCLK or one of the global clocks (CLK0 - CLK3). Each of these signals can be inverted if required.
	Clock Enable	RE or one of the global clocks (CLK1 - CLK 2). Each of these signals can be inverted if required.
	Reset	Created by the logical OR of the global reset signal and RST. RST is routed by the multifunction array from GRP, with inversion if desired.

Figure 15. PLL Block Diagram**Figure 16. Connection of Optional PLL Inputs and Outputs**

*See pinout table for details

In order to facilitate the multiply and divide capabilities of the PLL, each PLL has dividers associated with it: M, N and K. The M divider is used to divide the clock signal, while the N divider is used to multiply the clock signal. The K divider is only used when a secondary clock output is needed. This divider divides the primary clock output and feeds to a separate global clock net. The V divider is used to provide lower frequency output clocks, while maintaining a stable, high frequency output from the PLL's VCO circuit. The PLL also has a delay feature that allows the output clock to be advanced or delayed to improve set-up and clock-to-out times for better performance. For more information on the PLL, please refer to TN1003, [sysCLOCK PLL Usage Guide for ispXPGA, ispGDX2, ispXPLD and ispMACH 5000VG Devices](#).

1. Input or I/O leakage current is measured with the pin configured as an input or as an I/O with the output driver tristated. It is not measured with the output driver active. Bus maintenance circuits are disabled.
2. $T_A = 25^\circ C$, $f=1.0\text{MHz}$
3. I_{PU} on JTAG pins has a maximum of $-175\mu A$ for 5512MX devices.
4. 5V tolerant inputs and I/Os should be placed in banks where $3.0V \leq V_{CCO} \leq 3.6V$. The JTAG and sysCONFIG ports are not included for the 5V tolerant interface.

1. All grounds must be electrically connected at the board level.
2. NC pins should not be connected to any active signals, V_{CC} or GND.
3. Balls for GND, V_{CC} and V_{CCOx} are connected within the substrate to their respective common signals. Pin orientation A1 starts from the upper left corner of the top side view with alphabetical order ascending vertically and numerical order ascending horizontally.
4. Pin orientation follows the conventional counter-clockwise order from pin 1 marking of the topside view.
5. Internal GNDs and I/O GNDs (Bank 0 - Bank 3) are connected inside package. V_{CCO} balls connect to four power planes within the package, one each for V_{CCOx}.

1. Not available for differential pair.

Global Clock LVDS pair options: GCLK0 and GCLK1, as well as GCLK2 and GCLK3, can be paired together to receive differential clocks; where GCLK0 and GCLK3 are the positive LVDS inputs.

Global Clock LVDS pair options: GCLK0 and GCLK1, as well as GCLK2 and GCLK3, can be paired together to receive differential clocks; where GCLK0 and GCLK3 are the positive LVDS inputs.
