## Understanding [Embedded - CPLDs \(Complex Programmable Logic Devices\)](#)

Embedded - CPLDs, or Complex Programmable Logic Devices, are highly versatile digital logic devices used in electronic systems. These programmable components are designed to perform complex logical operations and can be customized for specific applications. Unlike fixed-function ICs, CPLDs offer the flexibility to reprogram their configuration, making them an ideal choice for various embedded systems. They consist of a set of logic gates and programmable interconnects, allowing designers to implement complex logic circuits without needing custom hardware.

## Applications of Embedded - CPLDs

### Details

|                                 |                                                                                                                                                                       |
|---------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Product Status                  | Obsolete                                                                                                                                                              |

## FIFO Mode

In FIFO Mode the multi-function array is configured as a FIFO (First In First Out) buffer with built in control. The read and write clocks can be different or the same dependent on the application. Four flags show the status of the FIFO; Full, Empty, Almost Full, and Almost Empty. The thresholds for Full, Almost full and Almost empty are programmable by the user. It is possible to reset the read pointer, allowing support of frame retransmit in communications applications. If desired, the block can be used in show ahead mode allowing the early reading of the next read address.

In this mode one ports accesses 16,384-bits of memory. Data widths of 1, 2, 4, 8, 16 and 32 are supported by the MFB. Figure 12 shows the block diagram of the FIFO.

Write data, write enable, flag outputs and read enable are synchronous. The Write Data, Almost Full and Full share the same clock and clock enables. Read outputs are synchronous although these can be configured in look ahead mode. The Read Data, Empty and Almost Empty signals share the same clock and clock enables. Reset is shared by all signals. Table 8 shows the possible sources for the clock, clock enable and reset signals for the various registers.

**Figure 12. FIFO Block Diagram**

**Table 8. Register Clocks, Clock Enables, and Initialization in FIFO Mode**

| Register                                | Input        | Source                                                                                                                                      |
|-----------------------------------------|--------------|---------------------------------------------------------------------------------------------------------------------------------------------|
| Write Data, Write Enable                | Clock        | WCLK or one of the global clocks (CLK0 - CLK3). Each of these signals can be inverted if required.                                          |
|                                         | Clock Enable | WE or one of the global clocks (CLK1 - CLK 2). Each of these signals can be inverted if required.                                           |
|                                         | Reset        | N/A                                                                                                                                         |
| Full and Almost Full Flags              | Clock        | WCLK or one of the global clocks (CLK0 - CLK3). Each of these signals can be inverted if required.                                          |
|                                         | Clock Enable | WE or one of the global clocks (CLK1 - CLK 2). Each of these signals can be inverted if required.                                           |
|                                         | Reset        | Created by the logical OR of the global reset signal and RST. RST is routed by the multifunction array from GRP, with inversion if desired. |
| Read Data, Empty and Almost Empty Flags | Clock        | RCLK or one of the global clocks (CLK0 - CLK3). Each of these signals can be inverted if required.                                          |
|                                         | Clock Enable | RE or one of the global clocks (CLK1 - CLK 2). Each of these signals can be inverted if required.                                           |
|                                         | Reset        | Created by the logical OR of the global reset signal and RST. RST is routed by the multifunction array from GRP, with inversion if desired. |

### sysIO Standards

Each I/O within a bank is individually configurable based on the  $V_{CCO}$  and  $V_{REF}$  settings. Some standards also require the use of an external termination voltage. Table 12 lists the sysIO standards with the typical values for  $V_{CCO}$ ,  $V_{REF}$  and  $V_{TT}$ . For more information on the sysIO capability, refer to TN1000, [sysIO Usage Guidelines for Lattice Devices](#).

Table 11. Number of I/Os per Bank

| Device          | Maximum Number of I/Os per Bank (n) |
|-----------------|-------------------------------------|
| ispXPLD 5256MX  | 36                                  |
| ispXPLD 5512MX  | 68                                  |
| ispXPLD 5768MX  | 96                                  |
| ispXPLD 51024MX | 96                                  |

### Programmable Slew Rate

The slew rate of outputs is carefully controlled. When outputs are configured as LVCMOS the devices support two slew rates. This allows system noise and performance to be balanced in a design.

### Programmable Bus-Maintenance

All general-purpose inputs have programmable bus maintenance circuitry. These are intended to maintain a valid logic level into a device when driving devices go into the tri-state mode. Four options are available for users: pull-up, pull-down, bus-keeper, or nothing.

## Expanded In-System Programmability (ispXP)

The ispXPLD 5000MX family utilizes a combination of EEPROM non-volatile cells and SRAM technology to deliver a logic solution that provides “instant-on” at power-up, a convenient single chip solution, and the capability for infinite reconfiguration. A non-volatile array distributed within the device stores the device configuration. At power-up this information is transferred in a massively parallel fashion into SRAM bits that control the operation of the device. Figure 18 shows the different ports and modes that are used in the configuration and programming of the ispXPLD 5000MX devices.

**Figure 18. ispXP Block Diagram**

### IEEE 1532 ISP

In-system programming of devices provides a number of significant benefits including rapid prototyping, lower inventory levels, higher quality and the ability to make in-field modifications. All ispXPLD 5000MX devices provide in-system programmability through their Boundary Scan Test Access Port. This capability has been implemented in a manner that ensures that the port remains compliant to the IEEE 1532 standard. By using IEEE 1532 as the communication interface through which ISP is achieved, customers get the benefit of a standard, well-defined interface.

The IEEE1532 programming interface allows programming of either the non-volatile array or reconfiguration of the SRAM bits.

The ispXPLD 5000MX devices can be programmed across the commercial temperature and voltage range. The PC-based Lattice software facilitates in-system programming of ispXPLD 5000MX devices. The software takes the JEDEC file output produced by the design implementation software, along with information about the scan chain, and creates a set of vectors used to drive the scan chain. The software can use these vectors to drive a scan chain via the parallel port of a PC. Alternatively, the software can output files in formats understood by common automated test equipment. This equipment can then be used to program ispXPLD 5000MX devices during the testing of a circuit board.

1. Software default setting.

2. The average DC current drawn by I/Os between adjacent bank GND connections, or between the last GND in an I/O bank and the end of the I/O bank, as shown in the logic signals connection table, shall not exceed  $n \cdot 8\text{mA}$ . Where n is the number of I/Os between bank GND connections or between the last GND in a bank and the end of a bank.3. For 1.8V devices (ispXPLD 5000MC) these specifications are  $V_{IL} = 0.35 \cdot V_{CC}$  and  $V_{IH} = 0.65 \cdot V_{CC}$ .4. For 1.8V devices (ispXPLD 5000MC) these specifications are  $V_{IL} = 0.3 \cdot V_{CC} \cdot 3.3/1.8$ ,  $V_{IH} = 0.5 \cdot V_{CC} \cdot 3.3/1.8$ .

Timing v.1.8

1. Timing numbers are based on default LVCMOS 1.8 I/O buffers. Use timing adjusters provided to calculate timing for other standards.
2. Measured using standard switching circuit, global routing loading of 1, worst case PTSA loading and 1 output switching.
3. Pulse widths and clock widths less than minimum will cause unknown behavior.
4. Standard 16-bit counter using GRP feedback.
5. CAM, FIFO, RAM  $f_{\text{MAX}}$  specification used shared PT Clk.

## Timing Model

The task of determining timing in a ispXPLD 5000MX device is relatively simple. The timing model shown in Figure 20 shows the specific delay paths. Once the implementation of a given function is determined either conceptually or from the software report file, the delay path of a function can easily be determined from the timing model. The Lattice design tools report the timing delays based on the same timing model. Note that internal timing parameters are for reference only, and are not tested. The external timing parameters are tested and guaranteed for every device.

1. All grounds must be electrically connected at the board level.

2. NC pins should not be connected to any active signals, V<sub>CC</sub> or GND.

3. Balls for GND, V<sub>CC</sub> and V<sub>CCOx</sub> are connected within the substrate to their respective common signals. Pin orientation A1 starts from the upper left corner of the top side view with alphabetical order ascending vertically and numerical order ascending horizontally.

4. Pin orientation follows the conventional counter-clockwise order from pin 1 marking of the topside view.

5. Internal GNDs and I/O GNDs (Bank 0 - Bank 3) are connected inside package. V<sub>CCO</sub> balls connect to four power planes within the package, one each for V<sub>CCOx</sub>.
