## Understanding [Embedded - CPLDs \(Complex Programmable Logic Devices\)](#)

Embedded - CPLDs, or Complex Programmable Logic Devices, are highly versatile digital logic devices used in electronic systems. These programmable components are designed to perform complex logical operations and can be customized for specific applications. Unlike fixed-function ICs, CPLDs offer the flexibility to reprogram their configuration, making them an ideal choice for various embedded systems. They consist of a set of logic gates and programmable interconnects, allowing designers to implement complex logic circuits without needing custom hardware.

## Applications of Embedded - CPLDs

### Details

Product Status	Obsolete
Programmable Type	In System Programmable
Delay Time tpd(1) Max	7.5 ns
Voltage Supply - Internal	3V ~ 3.6V
Number of Logic Elements/Blocks	16
Number of Macrocells	512
Number of Gates	-
Number of I/O	253
Operating Temperature	-40°C ~ 105°C (TJ)
Mounting Type	Surface Mount
Package / Case	484-BBGA
Supplier Device Package	484-FPBGA (23x23)
Purchase URL	<a href="https://www.e-xfl.com/product-detail/lattice-semiconductor/lc5512mv-75f484i">https://www.e-xfl.com/product-detail/lattice-semiconductor/lc5512mv-75f484i</a>

## Cascading For Wide Operation

In several modes it is possible to cascade adjacent MFBs to support wider operation. Table 2 details the different cascading options. There are chains of MFBs in each device which determine those MFBs that are adjacent for the purposes of cascading. Table 3 indicates these chains. The ispXPLD 5000MX design tools automatically cascade blocks if required by a particular design.

**Table 2. Cascading Modes For Wide Support**

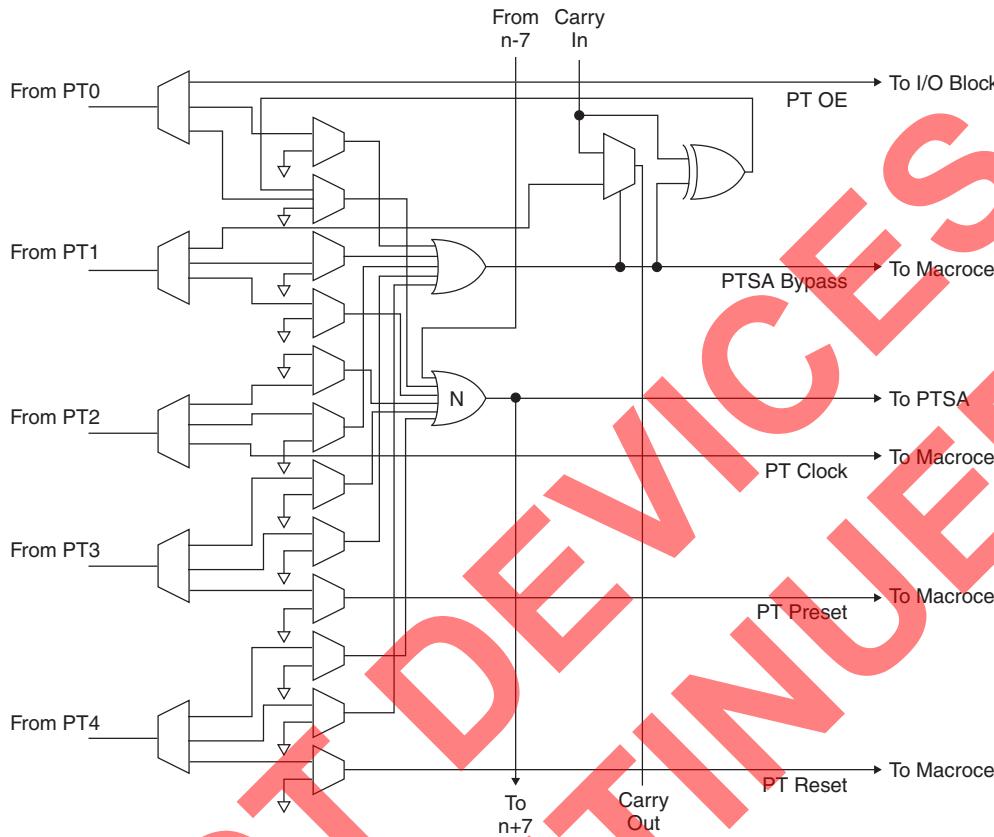

Mode	Cascading Function
Logic	<b>Input Width.</b> Allows two MFBs to act as a 136-input block.
	<b>Arithmetic.</b> Allow the carry chain to pass between two MFBs.
FIFO	<b>Memory Width Expansion.</b> Allows MFBs to be cascaded for greater width support.
CAM	<b>Memory Width Expansion.</b> Allows up to four MFBs to be cascaded for greater width support.

**Table 3. MFB Cascade Chain**

Device	MFBs in Cascade Chain
ispXPLD 5256MX	A → B → C → D
	H → G → F → E
ispXPLD 5512MX	A → B → C → D → E → F → G → H
	P → O → N → M → L → K → J → I
ispXPLD 5768MX	D → C → B → A → X → W → V → U → T → S → R → Q
	E → F → G → H → I → J → K → L → M → N → O → P
ispXPLD 51024MX	H → G → F → E → D → C → B → A → AF → AE → AD → AC → AB → AA → Z → Y
	I → J → K → L → M → N → O → P → Q → R → S → T → U → V → W → X

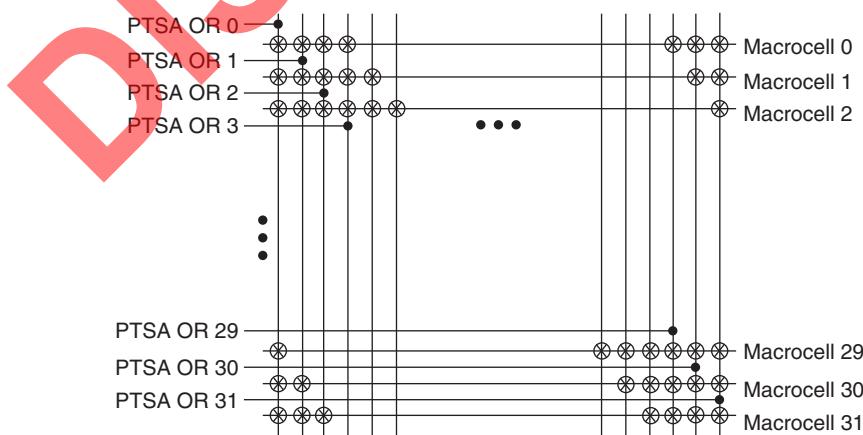

## SuperWIDE Logic Mode

In logic mode, each MFB contains 32 macrocells and a fully populated, programmable AND-array with 160 logic product terms and four control product terms. The MFB has 68 inputs from the Global Routing Pool, which are available in both true and complement form for every product term. It is also possible to cascade adjacent MFBs to create a block with 136 inputs. The four control product terms are used for shared reset, clock, clock enable, and output enable functions. Figure 3 shows the overall structure of the MFB in logic mode while Figure 4 provides a more detailed view from the perspective of a macrocell slice.

**Figure 6. Dual-OR PT Sharing Array**

### Product Term Sharing Array

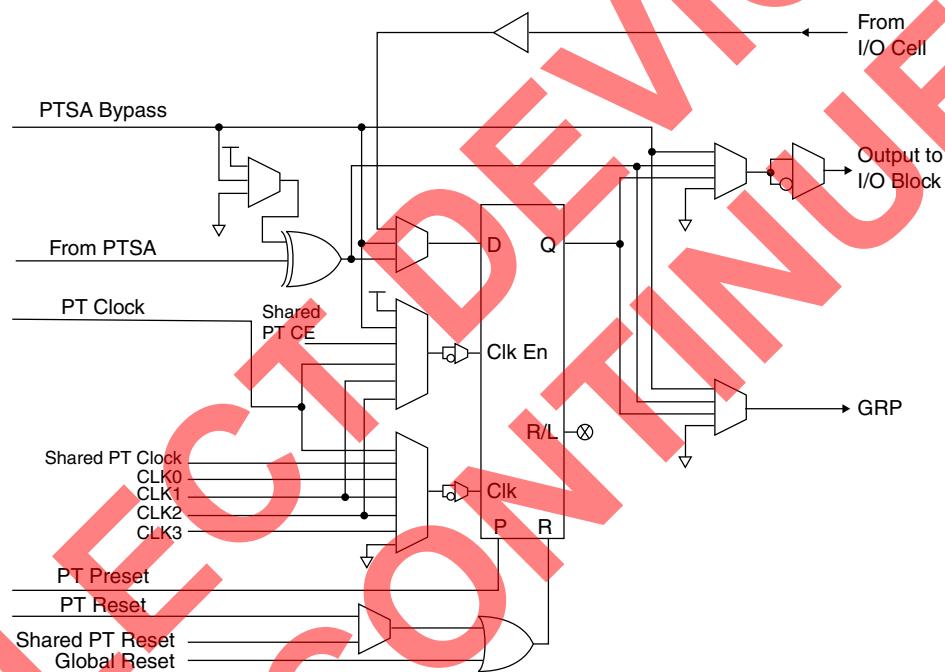

The Product Term Sharing Array (PTSA) consists of 32 inputs from the Dual-OR Array (Expandable PTSA OR) and 32 outputs directly to the macrocells. Each output is the OR term of any combination of the seven Expandable PTSA OR terms connected to that output. Every Nth macrocell is connected to N-3, N-2, N-1, N, N+1, N+2 and N+3 PTSA OR terms via a programmable connection. This wraps around the logic, for example, Macrocell 0 gets its logic from 29, 30, 31, 0, 1, 2, 3. The Expandable PTSA OR used in conjunction with the PTSA allows wide functions to be implemented easily and efficiently. Without using the Expandable PTSA OR capability, the greatest number of product terms that can be included in a single function with one pass of delay is 35. Up to 160 product terms can be included in a single function through the use of the expandable PTSA OR capability. Figure 7 shows the graphical representation of the PTSA.

**Figure 7. Product Term Sharing Array (PTSA)**

## Macrocell

The 32 registered macrocells in the MFB are driven by the 32 outputs from the PTSA or the PTSA bypass. Each macrocell contains a programmable XOR gate, a programmable register/latch flip-flop and the necessary clocks and control logic to allow combinatorial or registered operation. All macrocells have an output that feeds the GRP. Selected macrocells have an additional output that feeds the OSA and hence I/Os. This dual or concurrent output capability from the macrocell gives efficient use of the hardware resources. One output can be a registered function for example, while the other output can be an unrelated combinatorial function. A direct register input from the I/O cell facilitates efficient use of the macrocell to construct high-speed input registers. Macrocell registers can be clocked from one of several global or product term clocks available on the device. A global and product term clock enable is also provided, eliminating the need to gate the clock to the macrocell registers directly. Reset and preset for the macrocell register is provided from both global and product term signals. The macrocell register can be programmed to operate as a D-type register or a D-type latch. Figure 8 is a graphical representation of the macrocell.

**Figure 8. Macrocell**

## Memory Modes

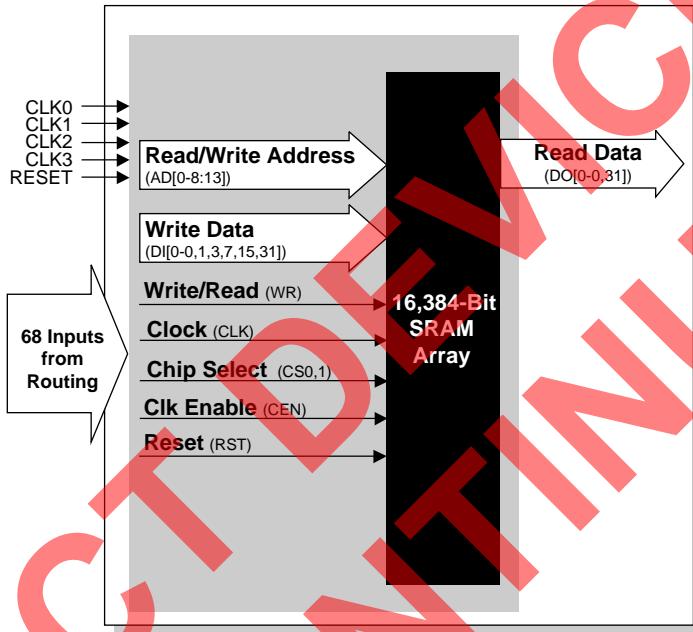

The ispXPLD 5000MX architecture allows the MFB to be configured as a variety of memory blocks as detailed in Table 4. The remainder of this section details operation of each of the memory modes. Additional information regarding the memory modes can also be found in TN1030, [Using Memory in ispXPLD 5000MX Devices](#).

## Single-Port SRAM Mode

In Single-Port SRAM Mode the multi-function array is configured as a single-port SRAM. In this mode one port accesses 16,384-bits of memory. Data widths of 1, 2, 4, 8, 16 and 32 are supported by the MFB. Figure 11 shows the block diagram of the single-port SRAM.

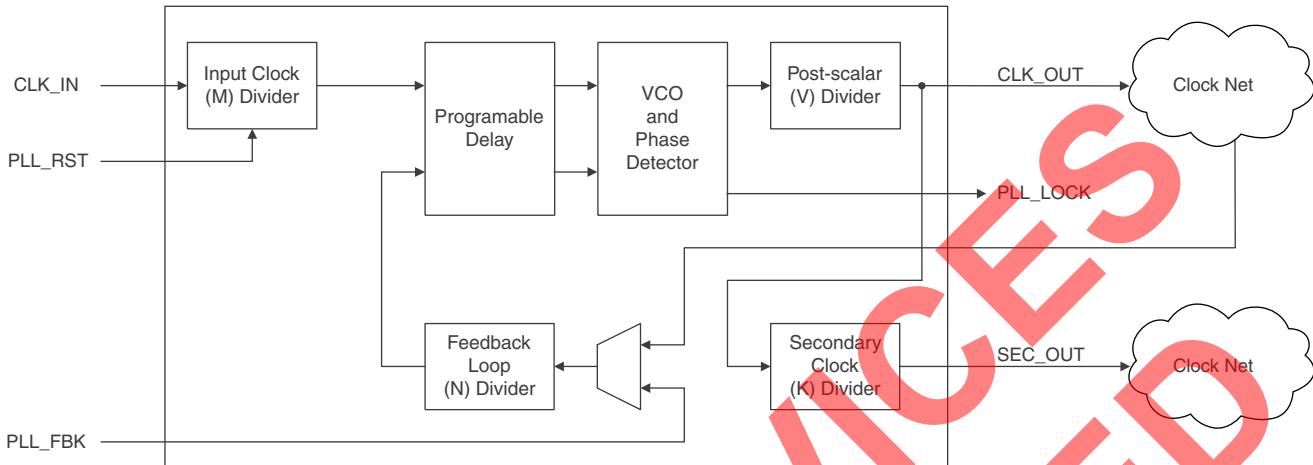

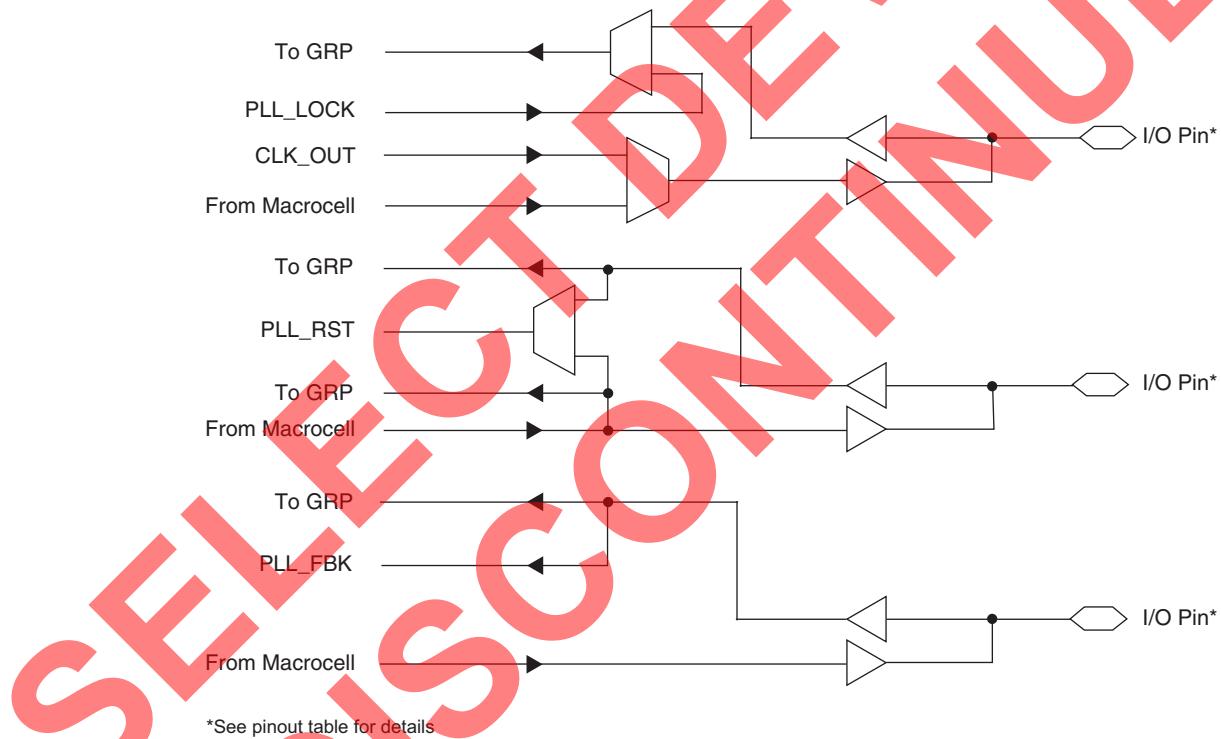

Write data, address, chip select and read/write signals are always synchronous (registered.) The output data signals can be synchronous or asynchronous. Reset is asynchronous. All signals share a common clock, clock enable, and reset. Table 7 shows the possible sources for the clock, clock enable and reset signals.

**Figure 11. Single-Port SRAM Block Diagram**

**Table 7. Register Clock, Clock Enable, and Reset in Single-Port SRAM Mode**

Register	Input	Source
Address, Write Data, Read Data, Read/Write, and Chip Select	Clock	CLK or one of the global clocks (CLK0 - CLK3). Each of these signals can be inverted if required.
	Clock Enable	CEN or one of the global clocks (CLK1 - CLK 2). Each of these signals can be inverted if required.
	Reset	Created by the logical OR of the global reset signal and RST. RST is routed by the multifunction array from GRP, with inversion if desired.

**Figure 15. PLL Block Diagram****Figure 16. Connection of Optional PLL Inputs and Outputs**

\*See pinout table for details

In order to facilitate the multiply and divide capabilities of the PLL, each PLL has dividers associated with it: M, N and K. The M divider is used to divide the clock signal, while the N divider is used to multiply the clock signal. The K divider is only used when a secondary clock output is needed. This divider divides the primary clock output and feeds to a separate global clock net. The V divider is used to provide lower frequency output clocks, while maintaining a stable, high frequency output from the PLL's VCO circuit. The PLL also has a delay feature that allows the output clock to be advanced or delayed to improve set-up and clock-to-out times for better performance. For more information on the PLL, please refer to TN1003, [sysCLOCK PLL Usage Guide for ispXPGA, ispGDX2, ispXPLD and ispMACH 5000VG Devices](#).

1. All grounds must be electrically connected at the board level.
2. NC pins should not be connected to any active signals, V<sub>CC</sub> or GND.
3. Balls for GND, V<sub>CC</sub> and V<sub>CCOx</sub> are connected within the substrate to their respective common signals. Pin orientation A1 starts from the upper left corner of the top side view with alphabetical order ascending vertically and numerical order ascending horizontally.
4. Pin orientation follows the conventional counter-clockwise order from pin 1 marking of the topside view.
5. Internal GNDs and I/O GNDs (Bank 0 - Bank 3) are connected inside package. V<sub>CCO</sub> balls connect to four power planes within the package, one each for V<sub>CCOx</sub>.

1. Not available for differential pair.

Global Clock LVDS pair options: GCLK0 and GCLK1, as well as GCLK2 and GCLK3, can be paired together to receive differential clocks; where GCLK0 and GCLK3 are the positive LVDS inputs.
