Understanding Embedded - CPLDs (Complex Programmable Logic Devices)

Embedded - CPLDs, or Complex Programmable Logic Devices, are highly versatile digital logic devices used in electronic systems. These programmable components are designed to perform complex logical operations and can be customized for specific applications. Unlike fixed-function ICs, CPLDs offer the flexibility to reprogram their configuration, making them an ideal choice for various embedded systems. They consist of a set of logic gates and programmable interconnects, allowing designers to implement complex logic circuits without needing custom hardware.

Figure 6. Dual-OR PT Sharing Array

Product Term Sharing Array

The Product Term Sharing Array (PTSA) consists of 32 inputs from the Dual-OR Array (Expandable PTSA OR) and 32 outputs directly to the macrocells. Each output is the OR term of any combination of the seven Expandable PTSA OR terms connected to that output. Every Nth macrocell is connected to N-3, N-2, N-1, N, N+1, N+2 and N+3 PTSA OR terms via a programmable connection. This wraps around the logic, for example, Macrocell 0 gets its logic from 29, 30, 31, 0, 1, 2, 3. The Expandable PTSA OR used in conjunction with the PTSA allows wide functions to be implemented easily and efficiently. Without using the Expandable PTSA OR capability, the greatest number of product terms that can be included in a single function with one pass of delay is 35. Up to 160 product terms can be included in a single function through the use of the expandable PTSA OR capability. Figure 7 shows the graphical representation of the PTSA.

Figure 7. Product Term Sharing Array (PTSA)

Single-Port SRAM Mode

In Single-Port SRAM Mode the multi-function array is configured as a single-port SRAM. In this mode one port accesses 16,384-bits of memory. Data widths of 1, 2, 4, 8, 16 and 32 are supported by the MFB. Figure 11 shows the block diagram of the single-port SRAM.

Write data, address, chip select and read/write signals are always synchronous (registered.) The output data signals can be synchronous or asynchronous. Reset is asynchronous. All signals share a common clock, clock enable, and reset. Table 7 shows the possible sources for the clock, clock enable and reset signals.

Figure 11. Single-Port SRAM Block Diagram

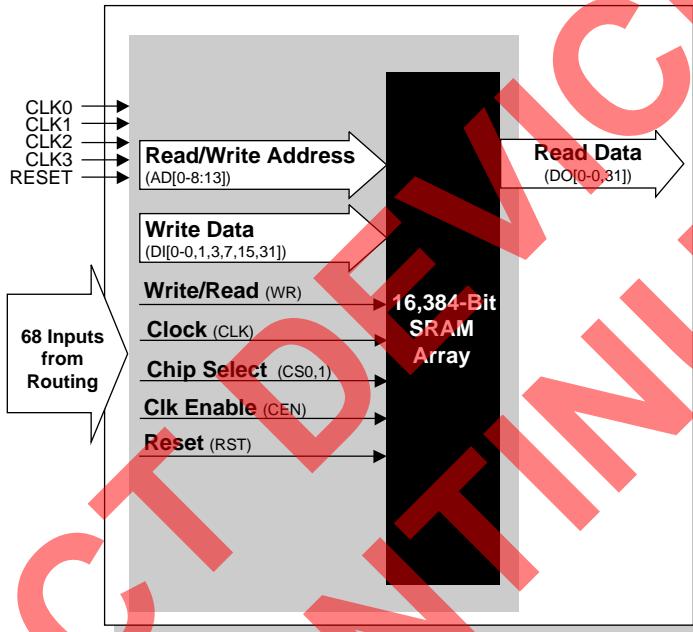

Table 7. Register Clock, Clock Enable, and Reset in Single-Port SRAM Mode

Register	Input	Source
Address, Write Data, Read Data, Read/Write, and Chip Select	Clock	CLK or one of the global clocks (CLK0 - CLK3). Each of these signals can be inverted if required.
	Clock Enable	CEN or one of the global clocks (CLK1 - CLK 2). Each of these signals can be inverted if required.
	Reset	Created by the logical OR of the global reset signal and RST. RST is routed by the multifunction array from GRP, with inversion if desired.

sysCONFIG Interface

In addition to being able to program the device through the IEEE 1532 interface a microprocessor style interface (sysCONFIG interface) allows reconfiguration of the SRAM bits within the device. For more information on the sysCONFIG capability, refer to TN1026, [ispXP Configuration Usage Guidelines](#).

Security Scheme

A programmable security scheme is provided on the ispXPLD 5000MX devices as a deterrent to unauthorized copying of the array configuration patterns. Once programmed, this bit prevents readback of the programmed pattern by a device programmer, securing proprietary designs from competitors. The security bit also prevents programming and verification. The entire device must be erased in order to erase the security bit.

Low Power Consumption

The ispXPLD 5000MX devices use zero power non-volatile cells along with full CMOS design to provide low static power consumption. The 1.8V core reduces dynamic power consumption compared with devices with higher core voltages. For information on estimating power consumption, refer to TN1031 [Power Estimation in ispXPLD 5000MX Devices](#).

Density Migration

The ispXPLD 5000MX family has been designed to ensure that different density devices in the same package have compatible pin-outs. Furthermore, the architecture ensures a high success rate when performing design migration from lower density parts to higher density parts. In many cases, it is possible to shift a lower utilization design targeted for a high-density device to a lower density device. However, the exact details of the final resource utilization will impact the likely success in each case.

IEEE 1149.1-Compliant Boundary Scan Testability

All ispXPLD 5000MX devices have boundary scan cells and are compliant to the IEEE 1149.1 standard. This allows functional testing of the circuit board on which the device is mounted through a serial scan path that can access all critical logic nodes. Internal boundary scan registers are linked internally, allowing test data to be shifted in and loaded directly onto test nodes, or test node data to be captured and shifted out for verification. In addition, these devices can be linked into a board-level serial scan path for board-level testing. The test access port has its own supply voltage and can operate with LVC MOS 3.3, 2.5 and 1.8V standards.

sysIO Quick Configuration

To facilitate the most efficient board test, the physical nature of the I/O cells must be set before running any continuity tests. As these tests are fast, by nature, the overhead and time that is required for configuration of the I/Os' physical nature should be minimal so that board test time is minimized. The ispXPLD 5000MX family of devices allows this by offering the user the ability to quickly configure the physical nature of the sysIO cells. This quick configuration takes milliseconds to complete, whereas it takes seconds for the entire device to be programmed. Lattice's ispVM™ System programming software can either perform the quick configuration through the PC parallel port, or can generate the ATE or test vectors necessary for a third-party test system.

1. Input or I/O leakage current is measured with the pin configured as an input or as an I/O with the output driver tristated. It is not measured with the output driver active. Bus maintenance circuits are disabled.
2. $T_A = 25^\circ C$, $f=1.0\text{MHz}$
3. I_{PU} on JTAG pins has a maximum of $-175\mu A$ for 5512MX devices.
4. 5V tolerant inputs and I/Os should be placed in banks where $3.0V \leq V_{CCO} \leq 3.6V$. The JTAG and sysCONFIG ports are not included for the 5V tolerant interface.

ICC_DC

Use the appropriate value for 5000MC (1.8V power supply) or 5000MV/B (2.5V/3.3V power supply) from the data sheet.

IMFB_CPLD

= ((K0 * CPLD MFB inputs + K1 * CPLD Logical Product Terms + K2 * CPLD GRP from MFB + K3 * CPLD GRP from IFB) * AF+ K4) * FREQ / 1000 μ A/mA

IMFB_CAM

= CAM Memory MFBs * ((FREQ * K8) + K9) (CAM operating in typical mode)

IMFB_SRAM/PDPRAM/FIFO

= (WR_PERCENT * (K1 + WR_PERCENT * 8 * K0 + K10 + K11) + RD_PERCENT * (K1 + 128 * RD_PERCENT * K0 + 8 * OSW_PERCENT * K2)) * SRAM/PDPRAM/FIFO Memory MFBs * FREQ / 1000 μ A/mA

IMFB_DPRAM

= (WR_PERCENT * (2 * K1 + 2 * WR_PERCENT * 8 * K0 + K10 + K11) + RD_PERCENT * (2 * K1 + 2 * 128 * RD_PERCENT * K0 + 8 * OSW_PERCENT * K2)) * DPRAM Memory MFBs * FREQ / 1000 μ A/mA

IPLL_D

= K5 * PLL_FREQ * number of PLLs used. IPPL_D is the PLL digital component of the VCC supply current.

Analog portion of PLL supply current consumption, from PLL power pin:

$$\text{IPLL_A} = (\text{K6} * \text{PLL_FREQ} + \text{K7}) * \text{number of PLLs used}$$

1. All grounds must be electrically connected at the board level.

2. NC pins should not be connected to any active signals, V_{CC} or GND.

3. Balls for GND, V_{CC} and V_{CCOx} are connected within the substrate to their respective common signals. Pin orientation A1 starts from the upper left corner of the top side view with alphabetical order ascending vertically and numerical order ascending horizontally.

4. Pin orientation follows the conventional counter-clockwise order from pin 1 marking of the topside view.

5. Internal GNDs and I/O GNDs (Bank 0 - Bank 3) are connected inside package. V_{CCO} balls connect to four power planes within the package, one each for V_{CCOx}.

Revision History

Date	Version	Change Summary
—	—	Previous Lattice releases.
December 2003	07	Added ispXPLD 5768MX information (supply current, timings, power consumption, power estimation coefficients, memory coefficients, logic signal connections, ordering part numbers).
		Updated ispXPLD 5000MX timing numbers (version v.1.7).
		Added lead-free package designator.
		Removed ispXPLD 5000MC industrial temperature grade ordering part numbers.
January 2004	08	Lead-free package release for the ispXPLD 5000MC and 5000MV devices.
		Timing model parameter tCOi correction - Maximum specification instead of Minimum (no changes in the timing numbers).
March 2004	08.1	Updated the MFB Cascade Chain table for the ispXPLD 5256MX device.
May 2004	09	Updated the ispXPLD 5000MX timing numbers (version v.1.8)
		ispXPLD 5256MC, 5512MC and 51024MC industrial temperature grade devices release
		Updated typical supply current data and condition.
		ispXPLD 5256MX 256-fpBGA logic signal connection tables: Removed internal signal description for ball H5 and G14.
August 2004	10	Added footnote "1, page 49. These inputs should not toggle during power up for proper power-up configuration." to CCLK and READ.
		Added ispXPLD 5768MC Industrial grade OPNs (Conventional and Lead-Free).
October 2004	10.1	Figure 19, LVPECL Driver with Three Resistor Pack has been updated (ispXPLD LVPECL Buffer changed to ispXPLD Emulated LVPECL Buffer)
November 2004	11	Added ispXPLD 5000MB (2.5V) Lead-Free Ordering Part Numbers.
December 2004	11.1	Pin name RESETB has been updated to RESET.
March 2005	12	208-PQFP Lead-free package release for the ispXPLD 5512MV/B/C devices.
April 2005	12.1	Page 23, clarification of footnote regarding IDK specification.
March 2006	12.2	Signal description for RESET has been updated.
April 2009	12.3	Ordering Information section has been updated to describe alternate LC5768MB/MV top side marking format.
February 2010	12.4	References to "system gates" changed to "functional gates."
