

Welcome to [E-XFL.COM](https://www.e-xfl.com)

### What is "[Embedded - Microcontrollers](#)"?

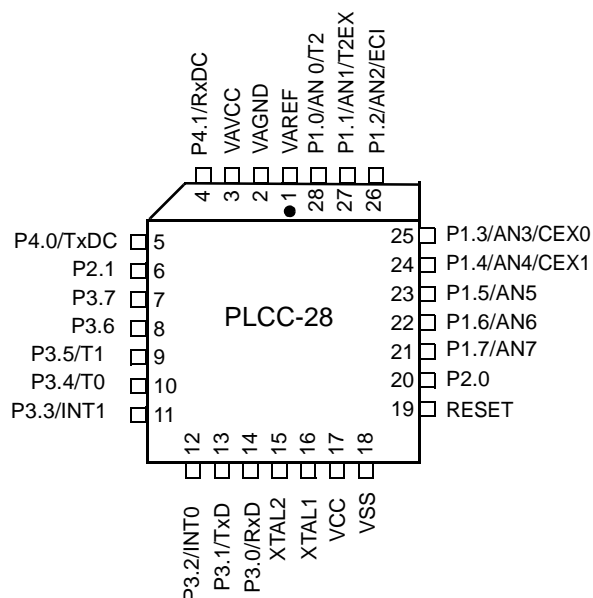

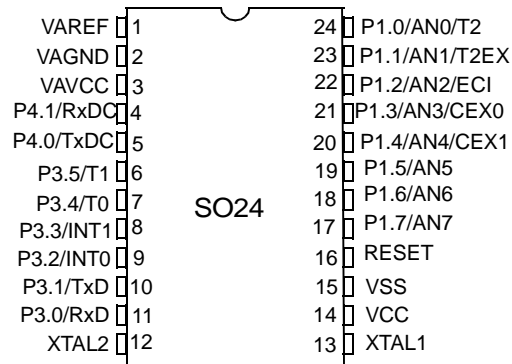

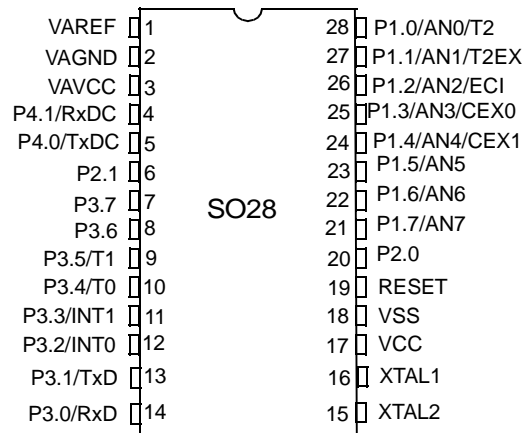

"[Embedded - Microcontrollers](#)" refer to small, integrated circuits designed to perform specific tasks within larger systems. These microcontrollers are essentially compact computers on a single chip, containing a processor core, memory, and programmable input/output peripherals. They are called "embedded" because they are embedded within electronic devices to control various functions, rather than serving as standalone computers. Microcontrollers are crucial in modern electronics, providing the intelligence and control needed for a wide range of applications.

### Applications of "[Embedded - Microcontrollers](#)"

#### Details

Product Status	Active
Core Processor	80C51
Core Size	8-Bit
Speed	40MHz
Connectivity	CANbus, UART/USART
Peripherals	POR, PWM, WDT
Number of I/O	20
Program Memory Size	16KB (16K x 8)
Program Memory Type	FLASH
EEPROM Size	2K x 8
RAM Size	512 x 8
Voltage - Supply (Vcc/Vdd)	3V ~ 5.5V
Data Converters	A/D 8x10b
Oscillator Type	External
Operating Temperature	-40°C ~ 85°C (TA)
Mounting Type	Surface Mount
Package / Case	32-LQFP
Supplier Device Package	32-VQFP (7x7)
Purchase URL	<a href="https://www.e-xfl.com/product-detail/microchip-technology/at89c51cc02ca-ratum">https://www.e-xfl.com/product-detail/microchip-technology/at89c51cc02ca-ratum</a>

## Pin Configurations

**Figure 4. Mode Switching Waveforms<sup>(1)</sup>**

**Note:** 1. In order to prevent any incorrect operation while operating in the X2 Mode, users must be aware that all peripherals using the clock frequency as a time reference (UART, timers...) will have their time reference divided by 2. For example, a free running timer generating an interrupt every 20 ms will then generate an interrupt every 10 ms. A UART with a 4800 baud rate will have a 9600 baud rate.

**Table 15.** Pin Conditions in Special Operating Modes

Mode	Port 1	Port 2	Port 3	Port 4
Reset	High	High	High	High
Idle (internal code)	Data	Data	Data	Data
Idle (external code)	Data	Data	Data	Data
Power- Down(inter- nal code)	Data	Data	Data	Data
Power- Down (external code)	Data	Data	Data	Data

**Figure 14.** Column Latches Loading Procedure<sup>(1)</sup>

Note: 1. The last page address used when loading the column latch is the one used to select the page programming address.

## Programming the Flash Spaces

### User

The following procedure is used to program the User space and is summarized in Figure 15:

- Load up to one page of data in the column latches from address 0000h to 3FFFh.
- Save then disable the interrupts.
- Launch the programming by writing the data sequence 50h followed by A0h in FCON register. This step must be executed from FM1.  
The end of the programming indicated by the FBUSY flag cleared.
- Restore the interrupts.

### Extra Row

The following procedure is used to program the Extra Row space and is summarized in Figure 15:

- Load data in the column latches from address FF80h to FFFFh.
- Save then disable the interrupts.
- Launch the programming by writing the data sequence 52h followed by A2h in FCON register. This step of the procedure must be executed from FM1.  
The end of the programming indicated by the FBUSY flag cleared.
- Restore the interrupts.

**Figure 16.** Hardware Programming Procedure

## Reading the Flash Spaces

### User

The following procedure is used to read the User space:

- Read one byte in Accumulator by executing `MOVC A, @A+DPTR` with `A+DPTR` is the address of the code byte to read.

Note: FCON must be cleared (00h) when not used.

### Extra Row

The following procedure is used to read the Extra Row space and is summarized in Figure 17:

- Map the Extra Row space by writing 02h in FCON register.
- Read one byte in Accumulator by executing `MOVC A, @A+DPTR` with `A= 0 & DPTR= FF80h to FFFFh`.
- Clear FCON to unmap the Extra Row.

### Hardware Security Byte

The following procedure is used to read the Hardware Security Byte and is summarized in Figure 17:

- Map the Hardware Security space by writing 04h in FCON register.
- Read the byte in Accumulator by executing `MOVC A, @A+DPTR` with `A= 0 & DPTR= 0000h`.
- Clear FCON to unmap the Hardware Security Byte.

**Figure 17.** Reading Procedure

Note: aa = 10 for the Hardware Security Byte.

### Flash Protection from Parallel Programming

The three lock bits in Hardware Security Byte (See 'In-System Programming' section) are programmed according to Table 24 provide different level of protection for the on-chip code and data located in FM0 and FM1.

The only way to write this bits are the parallel mode. They are set by default to level 3.

**Table 24.** Program Lock bit

Program Lock bits				Protection Description
Security Level	LB0	LB1	LB2	
1	U	U	U	No program lock features enabled.
2	P	U	U	Parallel programming of the Flash is disabled.
3	U	P	U	Same as 2, also verify through parallel programming interface is disabled. This is the factory default programming.
4	U	U	P	Same as 3

Note: 1. Program Lock bits  
U: unprogrammed  
P: programmed

**WARNING:** Security level 2, 3 and 4 should only be programmed after Flash and Core verification.

### Preventing Flash Corruption

See Section "Power Management".

## Programmable Clock-Output

In clock-out mode, Timer 2 operates as a 50%-duty-cycle, programmable clock generator (Figure 30). The input clock increments TL2 at frequency  $f_{OSC}/2$ . The timer repeatedly counts to overflow from a loaded value. At overflow, the contents of RCAP2H and RCAP2L registers are loaded into TH2 and TL2. In this mode, Timer 2 overflows do not generate interrupts. The formula gives the clock-out frequency depending on the system oscillator frequency and the value in the RCAP2H and RCAP2L registers:

$$Clock - OutFrequency = \frac{FT2clock}{4 \times (65536 - RCAP2H/RCAP2L)}$$

For a 16 MHz system clock in x1 mode, Timer 2 has a programmable frequency range of 61 Hz ( $f_{OSC}/2^{16}$ ) to 4 MHz ( $f_{OSC}/4$ ). The generated clock signal is brought out to T2 pin (P1.0).

Timer 2 is programmed for the clock-out mode as follows:

- Set T2OE bit in T2MOD register.
- Clear  $C/\overline{T2}$  bit in T2CON register.
- Determine the 16-bit reload value from the formula and enter it in RCAP2H/RCAP2L registers.
- Enter a 16-bit initial value in timer registers TH2/TL2. It can be the same as the reload value or different depending on the application.
- To start the timer, set TR2 run control bit in T2CON register.

It is possible to use Timer 2 as a baud rate generator and a clock generator simultaneously. For this configuration, the baud rates and clock frequencies are not independent since both functions use the values in the RCAP2H and RCAP2L registers.

Figure 30. Clock-Out Mode

## Registers

**Table 44.** T2CON Register  
T2CON (S:C8h)  
Timer 2 Control Register

7	6	5	4	3	2	1	0
TF2	EXF2	RCLK	TCLK	EXEN2	TR2	C/T2#	CP/RL2#
Bit Number	Bit Mnemonic	Description					
7	TF2	<b>Timer 2 Overflow Flag</b> TF2 is not set if RCLK=1 or TCLK = 1. Must be cleared by software. Set by hardware on Timer 2 overflow.					
6	EXF2	<b>Timer 2 External Flag</b> Set when a capture or a reload is caused by a negative transition on T2EX pin if EXEN2=1. Set to cause the CPU to vector to Timer 2 interrupt routine when Timer 2 interrupt is enabled. Must be cleared by software.					
5	RCLK	<b>Receive Clock bit</b> Clear to use timer 1 overflow as receive clock for serial port in mode 1 or 3. Set to use Timer 2 overflow as receive clock for serial port in mode 1 or 3.					
4	TCLK	<b>Transmit Clock bit</b> Clear to use timer 1 overflow as transmit clock for serial port in mode 1 or 3. Set to use Timer 2 overflow as transmit clock for serial port in mode 1 or 3.					
3	EXEN2	<b>Timer 2 External Enable bit</b> Clear to ignore events on T2EX pin for Timer 2 operation. Set to cause a capture or reload when a negative transition on T2EX pin is detected, if Timer 2 is not used to clock the serial port.					
2	TR2	<b>Timer 2 Run Control bit</b> Clear to turn off Timer 2. Set to turn on Timer 2.					
1	C/T2#	<b>Timer/Counter 2 Select bit</b> Clear for timer operation (input from internal clock system: $f_{OSC}$ ). Set for counter operation (input from T2 input pin).					
0	CP/RL2#	<b>Timer 2 Capture/Reload bit</b> If RCLK=1 or TCLK=1, CP/RL2# is ignored and timer is forced to auto-reload on Timer 2 overflow. Clear to auto-reload on Timer 2 overflows or negative transitions on T2EX pin if EXEN2=1. Set to capture on negative transitions on T2EX pin if EXEN2=1.					

Reset Value = 0000 0000b  
bit addressable

## Watchdog Timer During Power-down Mode and Idle

In Power-down mode the oscillator stops, which means the WDT also stops. While in Power-down mode, the user does not need to service the WDT. There are 2 methods of exiting Power-down mode: by a hardware reset or via a level activated external interrupt which is enabled prior to entering Power-down mode. When Power-down is exited with hardware reset, the watchdog is disabled. Exiting Power-down with an interrupt is significantly different. The interrupt shall be held low long enough for the oscillator to stabilize. When the interrupt is brought high, the interrupt is serviced. To prevent the WDT from resetting the device while the interrupt pin is held low, the WDT is not started until the interrupt is pulled high. It is suggested that the WDT be reset during the interrupt service for the interrupt used to exit Power-down.

To ensure that the WDT does not overflow within a few states of exiting powerdown, it is best to reset the WDT just before entering powerdown.

In the Idle mode, the oscillator continues to run. To prevent the WDT from resetting T89C51CC02 while in Idle mode, the user should always set up a timer that will periodically exit Idle, service the WDT, and re-enter Idle mode.

## Register

**Table 52.** WDTPRG Register

WDTPRG (S:A7h) – Watchdog Timer Duration Programming register

7	6	5	4	3	2	1	0
-	-	-	-	-	S2	S1	S0
Bit Number	Bit Mnemonic	Description					
7	-	<b>Reserved</b> The value read from this bit is indeterminate. Do not set this bit.					
6	-	<b>Reserved</b> The value read from this bit is indeterminate. Do not set this bit.					
5	-	<b>Reserved</b> The value read from this bit is indeterminate. Do not set this bit.					
4	-	<b>Reserved</b> The value read from this bit is indeterminate. Do not set this bit.					
3	-	<b>Reserved</b> The value read from this bit is indeterminate. Do not set this bit.					
2	S2	<b>Watchdog Timer Duration selection bit 2</b> Work in conjunction with bit 1 and bit 0.					
1	S1	<b>Watchdog Timer Duration selection bit 1</b> Work in conjunction with bit 2 and bit 0.					
0	S0	<b>Watchdog Timer Duration selection bit 0</b> Work in conjunction with bit 1 and bit 2.					

Reset Value = XXXX X000b

Figure 37. CAN Controller Memory Organization

**Figure 39. CAN Controller Interrupt Structure**

To enable a transmission interrupt:

- Enable General CAN IT in the interrupt system register
- Enable interrupt by message object, EICH<sub>i</sub>
- Enable transmission interrupt, ENTX

To enable a reception interrupt:

- Enable General CAN IT in the interrupt system register
- Enable interrupt by message object, EICH<sub>i</sub>
- Enable reception interrupt, ENRX

To enable an interrupt on message object error:

- Enable General CAN IT in the interrupt system register
- Enable interrupt by message object, EICH<sub>i</sub>
- Enable interrupt on error, ENERCH

To enable an interrupt on general error:

- Enable General CAN IT in the interrupt system register
- Enable interrupt on error, ENERG

## CAN Autobaud and Listening Mode

To activate the Autobaud feature, the AUTOBAUD bit in the CANGCON register must be set. In this mode, the CAN controller is only listening to the line without acknowledging the received messages. It cannot send any message. The error flags are updated. The bit timing can be adjusted until no error occurs (good configuration find).

In this mode, the error counters are frozen.

To go back to the standard mode, the AUTOBAUD bit must be cleared.

**Figure 45.** Autobaud Mode

## Routine Examples

```
1. Init of CAN macro
// Reset the CAN macro
CANGCON = 01h;
// Disable CAN interrupts
ECAN    = 0;
ETIM    = 0;
// Init the Mailbox
for num_page = 0; num_page < 4; num_page++
{
    CANPAGE = num_channel << 4;
    CANCONCH = 00h;
    CANSTCH = 00h;
    CANIDT1 = 00h;
    CANIDT2 = 00h;
    CANIDT3 = 00h;
    CANIDT4 = 00h;
    CANIDM1 = 00h;
    CANIDM2 = 00h;
    CANIDM3 = 00h;
    CANIDM4 = 00h;
    for num_data = 0; num_data < 8; num_data++
    {
        CANMSG = 00h;
    }
}
// Configure the bit timing
CANBT1 = xxh
CANBT2 = xxh
CANBT3 = xxh
```

**Table 59.** CANTEC Register  
CANTEC (S:9Ch Read Only) – CAN Transmit Error Counter

REC7	REC6	REC5	REC4	REC3	REC2	REC1	REC0
Bit Number		Bit Mnemonic		Description			
7 - 0		REC7:0		Reception Error Counter See Figure 42			

Reset Value = 00h

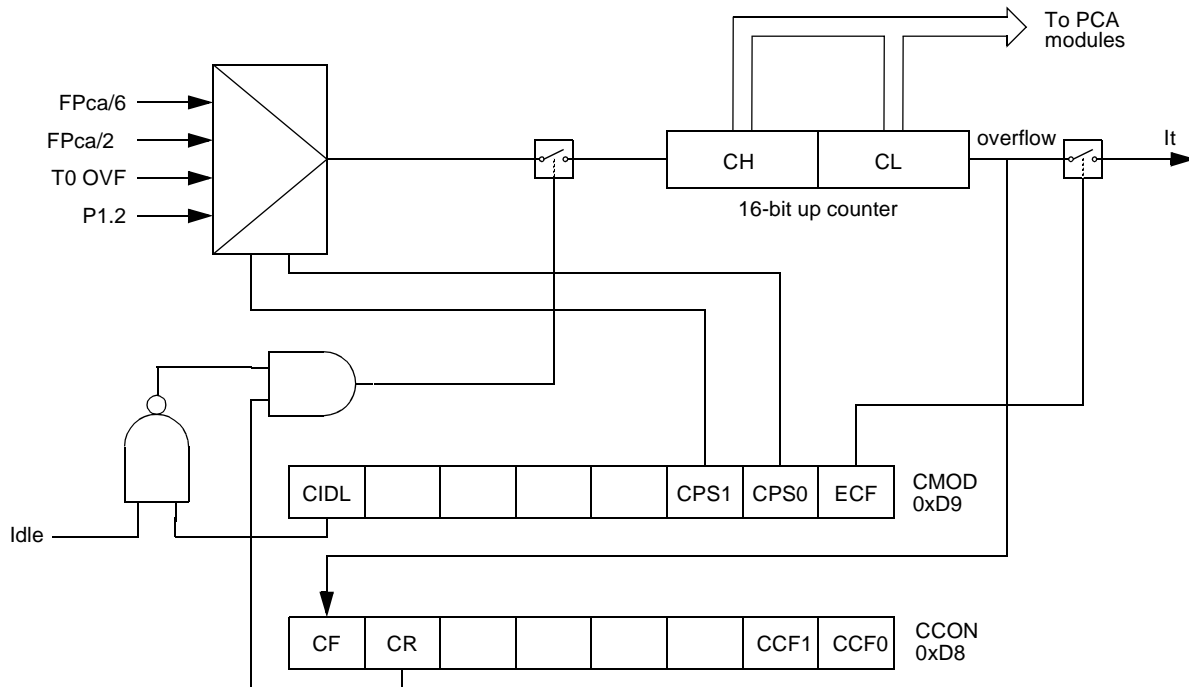

**Table 70.** CANSTCH Register  
CANSTCH (S:B2h) – CAN Message Object Status Register

7	6	5	4	3	2	1	0
DLCW	TXOK	RXOK	BERR	SERR	CERR	FERR	AERR
Bit Number	Bit Mnemonic	Description					
7	DLCW	<b>Data Length Code Warning</b> The incoming message does not have the DLC expected. Whatever the frame type, the DLC field of the CANCONCH register is updated by the received DLC.					
6	TXOK	<b>Transmit OK</b> The communication enabled by transmission is completed. When the controller is ready to send a frame, if two or more message objects are enabled as producers, the lower index message object (0 to 13) is supplied first. Must be cleared by software. This flag can generate an interrupt.					
5	RXOK	<b>Receive OK</b> The communication enabled by reception is completed. In the case of two or more message object reception hits, the lower index message object (0 to 13) is updated first. Must be cleared by software. This flag can generate an interrupt.					
4	BERR	<b>bit Error (only in transmission)</b> The bit value monitored is different from the bit value sent. Exceptions: the monitored recessive bit sent as a dominant bit during the arbitration field and the acknowledge slot detecting a dominant bit during the sending of an error frame. Must be cleared by software. This flag can generate an interrupt.					
3	SERR	<b>Stuff Error</b> Detection of more than five consecutive bits with the same polarity. Must be cleared by software. This flag can generate an interrupt.					
2	CERR	<b>CRC Error</b> The receiver performs a CRC check on each destuffed received message from the start of frame up to the data field. If this checking does not match with the destuffed CRC field, a CRC error is set. Must be cleared by software. This flag can generate an interrupt.					
1	FERR	<b>Form Error</b> The form error results from one or more violations of the fixed form in the following bit fields: CRC delimiter acknowledgment delimiter end_of_frame Must be cleared by software. This flag can generate an interrupt.					
0	AERR	<b>Acknowledgment Error</b> No detection of the dominant bit in the acknowledge slot. Must be cleared by software. This flag can generate an interrupt.					

Note: See Figure 39.

No default value after reset.

Figure 46. PCA Timer/Counter

The CMOD register includes three additional bits associated with the PCA.

- The CIDL bit which allows the PCA to stop during idle mode.
- The ECF bit which when set causes an interrupt and the PCA overflow flag CF in CCON register to be set when the PCA timer overflows.

The CCON register contains the run control bit for the PCA and the flags for the PCA timer and each module.

- The CR bit must be set to run the PCA. The PCA is shut off by clearing this bit.
- The CF bit is set when the PCA counter overflows and an interrupt will be generated if the ECF bit in CMOD register is set. The CF bit can only be cleared by software.
- The CCF0:1 bits are the flags for the modules (CCF0 for module0...) and are set by hardware when either a match or a capture occurs. These flags also can be cleared by software.

The bits SCH0 to SCH2 in ADCON register are used for the analog input channel selection.

**Table 102.** Selected Analog input

SCH2	SCH1	SCH0	Selected Analog Input
0	0	0	AN0
0	0	1	AN1
0	1	0	AN2
0	1	1	AN3
1	0	0	AN4
1	0	1	AN5
1	1	0	AN6
1	1	1	AN7

## Voltage Conversion

When the ADCIN is equals to VAREF the ADC converts the signal to 3FFh (full scale). If the input voltage equals VAGND, the ADC converts it to 000h. Input voltage between VAREF and VAGND are a straight-line linear conversion. All other voltages will result in 3FFh if greater than VAREF and 000h if less than VAGND.

Note that ADCIN should not exceed VAREF absolute maximum range (See section “AC-DC”).

## Clock Selection

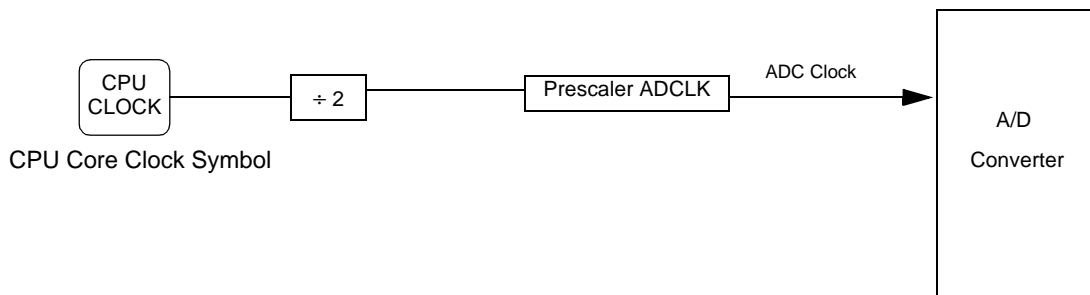

The ADC clock is the same as CPU.

The maximum clock frequency is defined in the DC parameter for A/D converter. A prescaler is featured (ADCCLK) to generate the ADC clock from the oscillator frequency.

if  $PRS = 0$  then  $F_{ADC} = F_{periph} / 64$

if  $PRS > 0$  then  $F_{ADC} = F_{periph} / 2 \times PRS$

**Figure 54.** A/D Converter Clock

## ADC Standby Mode

When the ADC is not used, it is possible to set it in standby mode by clearing bit ADEN in ADCON register. In this mode the power dissipation is reduced.
