Understanding [Embedded - FPGAs \(Field Programmable Gate Array\)](#)

Embedded - FPGAs, or Field Programmable Gate Arrays, are advanced integrated circuits that offer unparalleled flexibility and performance for digital systems. Unlike traditional fixed-function logic devices, FPGAs can be programmed and reprogrammed to execute a wide array of logical operations, enabling customized functionality tailored to specific applications. This reprogrammability allows developers to iterate designs quickly and implement complex functions without the need for custom hardware.

Applications of Embedded - FPGAs

The versatility of Embedded - FPGAs makes them indispensable in numerous fields. In telecommunications.

Details

Product Status	Active
Number of LABs/CLBs	250
Number of Logic Elements/Cells	4000
Total RAM Bits	193536
Number of I/O	112
Number of Gates	-
Voltage - Supply	2.85V ~ 3.465V
Mounting Type	Surface Mount
Operating Temperature	0°C ~ 85°C (TJ)
Package / Case	153-VFBGA
Supplier Device Package	153-MBGA (8x8)
Purchase URL	https://www.e-xfl.com/product-detail/intel/10m04scm153c8g

Intel® MAX® 10 FPGA Device Overview

Intel® MAX® 10 devices are single-chip, non-volatile low-cost programmable logic devices (PLDs) to integrate the optimal set of system components.

The highlights of the Intel MAX 10 devices include:

- Internally stored dual configuration flash
- User flash memory
- Instant on support
- Integrated analog-to-digital converters (ADCs)
- Single-chip Nios II soft core processor support

Intel MAX 10 devices are the ideal solution for system management, I/O expansion, communication control planes, industrial, automotive, and consumer applications.

Key Advantages of Intel MAX 10 Devices

Table 1. Key Advantages of Intel MAX 10 Devices

Advantage	Supporting Feature
Simple and fast configuration	Secure on-die flash memory enables device configuration in less than 10 ms
Flexibility and integration	<ul style="list-style-type: none"> • Single device integrating PLD logic, RAM, flash memory, digital signal processing (DSP), ADC, phase-locked loop (PLL), and I/Os • Small packages available from 3 mm × 3 mm
Low power	<ul style="list-style-type: none"> • Sleep mode—significant standby power reduction and resumption in less than 1 ms • Longer battery life—resumption from full power-off in less than 10 ms
20-year-estimated life cycle	Built on TSMC's 55 nm embedded flash process technology
High productivity design tools	<ul style="list-style-type: none"> • Intel Quartus® Prime Lite edition (no cost license) • Platform Designer (Standard) system integration tool • DSP Builder for Intel FPGAs • Nios® II Embedded Design Suite (EDS)

Summary of Intel MAX 10 Device Features

Table 2. Summary of Features for Intel MAX 10 Devices

Feature	Description
Technology	55 nm TSMC Embedded Flash (Flash + SRAM) process technology
Packaging	<ul style="list-style-type: none">• Low cost, small form factor packages—support multiple packaging technologies and pin pitches• Multiple device densities with compatible package footprints for seamless migration between different device densities• RoHS6-compliant
Core architecture	<ul style="list-style-type: none">• 4-input look-up table (LUT) and single register logic element (LE)• LEs arranged in logic array block (LAB)• Embedded RAM and user flash memory• Clocks and PLLs• Embedded multiplier blocks• General purpose I/Os
Internal memory blocks	<ul style="list-style-type: none">• M9K—9 kilobits (Kb) memory blocks• Cascadable blocks to create RAM, dual port, and FIFO functions
User flash memory (UFM)	<ul style="list-style-type: none">• User accessible non-volatile storage• High speed operating frequency• Large memory size• High data retention• Multiple interface option
Embedded multiplier blocks	<ul style="list-style-type: none">• One 18 × 18 or two 9 × 9 multiplier modes• Cascadable blocks enabling creation of filters, arithmetic functions, and image processing pipelines
ADC	<ul style="list-style-type: none">• 12-bit successive approximation register (SAR) type• Up to 17 analog inputs• Cumulative speed up to 1 million samples per second (MSPS)• Integrated temperature sensing capability
Clock networks	<ul style="list-style-type: none">• Global clocks support• High speed frequency in clock network
Internal oscillator	Built-in internal ring oscillator
PLLs	<ul style="list-style-type: none">• Analog-based• Low jitter• High precision clock synthesis• Clock delay compensation• Zero delay buffering• Multiple output taps
General-purpose I/Os (GPIOs)	<ul style="list-style-type: none">• Multiple I/O standards support• On-chip termination (OCT)• Up to 830 megabits per second (Mbps) LVDS receiver, 800 Mbps LVDS transmitter
External memory interface (EMIF) ⁽¹⁾	Supports up to 600 Mbps external memory interfaces:
continued...	

⁽¹⁾ EMIF is only supported in selected Intel MAX 10 device density and package combinations. Refer to the *External Memory Interface User Guide* for more information.

Feature	Description
	<ul style="list-style-type: none"> DDR3, DDR3L, DDR2, LPDDR2 (on 10M16, 10M25, 10M40, and 10M50.) SRAM (Hardware support only) <p><i>Note:</i> For 600 Mbps performance, –6 device speed grade is required. Performance varies according to device grade (commercial, industrial, or automotive) and device speed grade (–6 or –7). Refer to the <i>Intel MAX 10 FPGA Device Datasheet</i> or <i>External Memory Interface Spec Estimator</i> for more details.</p>
Configuration	<ul style="list-style-type: none"> Internal configuration JTAG Advanced Encryption Standard (AES) 128-bit encryption and compression options Flash memory data retention of 20 years at 85 °C
Flexible power supply schemes	<ul style="list-style-type: none"> Single- and dual-supply device options Dynamically controlled input buffer power down Sleep mode for dynamic power reduction

Intel MAX 10 Device Ordering Information

Figure 1. Sample Ordering Code and Available Options for Intel MAX 10 Devices

Note: The –I6 and –A6 speed grades of the Intel MAX 10 FPGA devices are not available by default in the Intel Quartus Prime software. Contact your local Intel sales representatives for support.

Intel MAX 10 Vertical Migration Support

Vertical migration supports the migration of your design to other Intel MAX 10 devices of different densities in the same package with similar I/O and ADC resources.

Intel MAX 10 I/O Vertical Migration Support

Figure 2. Migration Capability Across Intel MAX 10 Devices

- The arrows indicate the migration paths. The devices included in each vertical migration path are shaded. Non-migratable devices are omitted. Some packages have several migration paths. Devices with lesser I/O resources in the same path have lighter shades.
- To achieve the full I/O migration across product lines in the same migration path, restrict I/Os usage to match the product line with the lowest I/O count.

Device	Package

Dual ADC Device: Each ADC (ADC1 and ADC2) supports 1 dedicated analog input pin and 8 dual function pins.
Single ADC Device: Single ADC that supports 1 dedicated analog input pin and 16 dual function pins.
Single ADC Device: Single ADC that supports 1 dedicated analog input pin and 8 dual function pins.

**Table 7. Pin Migration Conditions for ADC Migration**

Source	Target	Migratable Pins
Single ADC device	Single ADC device	You can migrate all ADC input pins
Dual ADC device	Dual ADC device	
Single ADC device	Dual ADC device	<ul style="list-style-type: none"> One dedicated analog input pin. Eight dual function pins from the ADC1 block of the source device to the ADC1 block of the target device.
Dual ADC device	Single ADC device	

Logic Elements and Logic Array Blocks

The LAB consists of 16 logic elements (LE) and a LAB-wide control block. An LE is the smallest unit of logic in the Intel MAX 10 device architecture. Each LE has four inputs, a four-input look-up table (LUT), a register, and output logic. The four-input LUT is a function generator that can implement any function with four variables.

Figure 4. Intel MAX 10 Device Family LEs

Analog-to-Digital Converter

Intel MAX 10 devices feature up to two ADCs. You can use the ADCs to monitor many different signals, including on-chip temperature.

Table 8. ADC Features

Feature	Description
12-bit resolution	<ul style="list-style-type: none"> Translates analog signal to digital data for information processing, computing, data transmission, and control systems Provides a 12-bit digital representation of the observed analog signal
Up to 1 MSPS sampling rate	Monitors single-ended external inputs with a cumulative sampling rate of 25 kilosamples per second to 1 MSPS in normal mode
<i>continued...</i>	

Feature	Description
Up to 17 single-ended external inputs for single ADC devices	One dedicated analog and 16 dual function input pins
Up to 18 single-ended external inputs for dual ADC devices	<ul style="list-style-type: none">One dedicated analog and eight dual-function input pins in each ADC blockSimultaneous measurement capability for dual ADC devices
On-chip temperature sensor	Monitors external temperature data input with a sampling rate of up to 50 kilosamples per second

User Flash Memory

The user flash memory (UFM) block in Intel MAX 10 devices stores non-volatile information.

UFM provides an ideal storage solution that you can access using Avalon Memory-Mapped (Avalon-MM) slave interface protocol.

Table 9. UFM Features

Features	Capacity
Endurance	Counts to at least 10,000 program/erase cycles
Data retention	<ul style="list-style-type: none">20 years at 85 °C10 years at 100 °C
Operating frequency	Maximum 116 MHz for parallel interface and 7.25 MHz for serial interface
Data length	Stores data up to 32 bits length in parallel

Embedded Multipliers and Digital Signal Processing Support

Intel MAX 10 devices support up to 144 embedded multiplier blocks. Each block supports one individual 18 × 18-bit multiplier or two individual 9 × 9-bit multipliers.

With the combination of on-chip resources and external interfaces in Intel MAX 10 devices, you can build DSP systems with high performance, low system cost, and low power consumption.

You can use the Intel MAX 10 device on its own or as a DSP device co-processor to improve price-to-performance ratios of DSP systems.

You can control the operation of the embedded multiplier blocks using the following options:

- Parameterize the relevant IP cores with the Intel Quartus Prime parameter editor
- Infer the multipliers directly with VHDL or Verilog HDL

System design features provided for Intel MAX 10 devices:

- DSP IP cores:
 - Common DSP processing functions such as finite impulse response (FIR), fast Fourier transform (FFT), and numerically controlled oscillator (NCO) functions
 - Suites of common video and image processing functions
- Complete reference designs for end-market applications
- DSP Builder for Intel FPGAs interface tool between the Intel Quartus Prime software and the MathWorks Simulink and MATLAB design environments
- DSP development kits

Embedded Memory Blocks

The embedded memory structure consists of M9K memory blocks columns. Each M9K memory block of a Intel MAX 10 device provides 9 Kb of on-chip memory capable of operating at up to 284 MHz. The embedded memory structure consists of M9K memory blocks columns. Each M9K memory block of a Intel MAX 10 device provides 9 Kb of on-chip memory. You can cascade the memory blocks to form wider or deeper logic structures.

You can configure the M9K memory blocks as RAM, FIFO buffers, or ROM.

The Intel MAX 10 device memory blocks are optimized for applications such as high throughput packet processing, embedded processor program, and embedded data storage.

Table 10. M9K Operation Modes and Port Widths

Operation Modes	Port Widths
Single port	×1, ×2, ×4, ×8, ×9, ×16, ×18, ×32, and ×36
Simple dual port	×1, ×2, ×4, ×8, ×9, ×16, ×18, ×32, and ×36
True dual port	×1, ×2, ×4, ×8, ×9, ×16, and ×18

Clocking and PLL

Intel MAX 10 devices offer the following resources: global clock (GCLK) networks and phase-locked loops (PLLs) with a 116-MHz built-in oscillator.

Intel MAX 10 devices support up to 20 global clock (GCLK) networks with operating frequency up to 450 MHz. The GCLK networks have high drive strength and low skew.

The PLLs provide robust clock management and synthesis for device clock management, external system clock management, and I/O interface clocking. The high precision and low jitter PLLs offers the following features:

- Reduction in the number of oscillators required on the board
- Reduction in the device clock pins through multiple clock frequency synthesis from a single reference clock source
- Frequency synthesis
- On-chip clock de-skew
- Jitter attenuation
- Dynamic phase-shift

- Zero delay buffer
- Counter reconfiguration
- Bandwidth reconfiguration
- Programmable output duty cycle
- PLL cascading
- Reference clock switchover
- Driving of the ADC block

FPGA General Purpose I/O

The Intel MAX 10 I/O buffers support a range of programmable features.

These features increase the flexibility of I/O utilization and provide an alternative to reduce the usage of external discrete components such as a pull-up resistor and a PCI clamp diode.

External Memory Interface

Dual-supply Intel MAX 10 devices feature external memory interfaces solution that uses the I/O elements on the right side of the devices together with the UniPHY IP.

With this solution, you can create external memory interfaces to 16-bit SDRAM components with error correction coding (ECC).

Note: The external memory interface feature is available only for dual-supply Intel MAX 10 devices.

Table 11. External Memory Interface Performance

External Memory Interface ⁽³⁾	I/O Standard	Maximum Width	Maximum Frequency (MHz)
DDR3 SDRAM	SSTL-15	16 bit + 8 bit ECC	303
DDR3L SDRAM	SSTL-135	16 bit + 8 bit ECC	303
DDR2 SDRAM	SSTL-18	16 bit + 8 bit ECC	200
LPDDR2 SDRAM	HSUL-12	16 bit without ECC	200 ⁽⁴⁾

Related Links

[External Memory Interface Spec Estimator](#)

Provides a parametric tool that allows you to find and compare the performance of the supported external memory interfaces in Intel FPGAs.

⁽³⁾ The device hardware supports SRAM. Use your own design to interface with SRAM devices.

⁽⁴⁾ To achieve the specified performance, constrain the memory device I/O and core power supply variation to within $\pm 3\%$. By default, the frequency is 167 MHz.

Configuration

Table 12. Configuration Features

Feature	Description
Dual configuration	<ul style="list-style-type: none"> Stores two configuration images in the configuration flash memory (CFM) Selects the first configuration image to load using the CONFIG_SEL pin
Design security	<ul style="list-style-type: none"> Supports 128-bit key with non-volatile key programming Limits access of the JTAG instruction during power-up in the JTAG secure mode Unique device ID for each Intel MAX 10 device
SEU Mitigation	<ul style="list-style-type: none"> Auto-detects cyclic redundancy check (CRC) errors during configuration Provides optional CRC error detection and identification in user mode
Dual-purpose configuration pin	<ul style="list-style-type: none"> Functions as configuration pins prior to user mode Provides options to be used as configuration pin or user I/O pin in user mode
Configuration data compression	<ul style="list-style-type: none"> Decompresses the compressed configuration bitstream data in real-time during configuration Reduces the size of configuration image stored in the CFM
Instant-on	Provides the fastest power-up mode for Intel MAX 10 devices.

Table 13. Configuration Schemes for Intel MAX 10 Devices

Configuration Scheme	Compression	Encryption	Dual Image Configuration	Data Width
Internal Configuration	Yes	Yes	Yes	—
JTAG	—	—	—	1

Power Management

Table 14. Power Options

Power Options	Advantage
Single-supply device	Saves board space and costs.
Dual-supply device	<ul style="list-style-type: none"> Consumes less power Offers higher performance
Power management controller scheme	<ul style="list-style-type: none"> Reduces dynamic power consumption when certain applications are in standby mode Provides a fast wake-up time of less than 1 ms.
