

Welcome to [E-XFL.COM](#)

### What is "[Embedded - Microcontrollers](#)"?

"[Embedded - Microcontrollers](#)" refer to small, integrated circuits designed to perform specific tasks within larger systems. These microcontrollers are essentially compact computers on a single chip, containing a processor core, memory, and programmable input/output peripherals. They are called "embedded" because they are embedded within electronic devices to control various functions, rather than serving as standalone computers. Microcontrollers are crucial in modern electronics, providing the intelligence and control needed for a wide range of applications.

### Applications of "[Embedded - Microcontrollers](#)"

#### Details

|                            |                                                                                                                                                                                 |
|----------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Product Status             | Obsolete                                                                                                                                                                        |
| Core Processor             | RX                                                                                                                                                                              |
| Core Size                  | 32-Bit Single-Core                                                                                                                                                              |
| Speed                      | 32MHz                                                                                                                                                                           |
| Connectivity               | I <sup>2</sup> C, IrDA, SCI, SPI, SSI, USB OTG                                                                                                                                  |
| Peripherals                | DMA, LCD, LVD, POR, PWM, WDT                                                                                                                                                    |
| Number of I/O              | 80                                                                                                                                                                              |
| Program Memory Size        | 512KB (512K x 8)                                                                                                                                                                |
| Program Memory Type        | FLASH                                                                                                                                                                           |
| EEPROM Size                | 8K x 8                                                                                                                                                                          |
| RAM Size                   | 64K x 8                                                                                                                                                                         |
| Voltage - Supply (Vcc/Vdd) | 1.8V ~ 3.6V                                                                                                                                                                     |
| Data Converters            | A/D 17x12b; D/A 2x12b                                                                                                                                                           |
| Oscillator Type            | Internal                                                                                                                                                                        |
| Operating Temperature      | -40°C ~ 85°C (TA)                                                                                                                                                               |
| Mounting Type              | Surface Mount                                                                                                                                                                   |
| Package / Case             | 100-TFLGA                                                                                                                                                                       |
| Supplier Device Package    | 100-TFLGA (7x7)                                                                                                                                                                 |

**Table 1.4 Pin Functions (4/4)**

| Classifications | Pin Name                | I/O    | Description                                                       |
|-----------------|-------------------------|--------|-------------------------------------------------------------------|
| Comparator B    | CMPB0                   | Input  | Input pin for the analog signal to be processed by comparator B0. |
|                 | CVREFB0                 | Input  | Analog reference voltage supply pin for comparator B0.            |
|                 | CMPB1                   | Input  | Input pin for the analog signal to be processed by comparator B1. |
|                 | CVREFB1                 | Input  | Analog reference voltage supply pin for comparator B1.            |
|                 | CMPOB0                  | Output | Output pin for comparator B0.                                     |
|                 | CMPOB1                  | Output | Output pin for comparator B1.                                     |
| LCD             | VL1, VL2, VL3, VL4      | I/O    | Voltage pin for driving the LCD.                                  |
|                 | CAPH, CAPL              | I/O    | Capacitor connection pin for the LCD controller/driver.           |
|                 | COM0 to COM7            | Output | Common signal output pins for the LCD controller/driver.          |
|                 | SEG00 to SEG39          | Output | Segment signal output pins for the LCD controller/driver.         |
| CTS             | TS0 to TS11             | Input  | Capacitive touch detection pins (touch pins).                     |
|                 | TSCAP                   | I/O    | Secondary power supply pin for the touch driver.                  |
| I/O ports       | P02, P04, P07           | I/O    | 3-bit input/output pins.                                          |
|                 | P10 to P17              | I/O    | 8-bit input/output pins.                                          |
|                 | P20 to P27              | I/O    | 8-bit input/output pins.                                          |
|                 | P30 to P32, P35         | I/O    | 4-bit input/output pins (P35 input pin).                          |
|                 | P40 to P44, P46         | I/O    | 6-bit input/output pins.                                          |
|                 | P50 to P56              | I/O    | 7-bit input/output pins.                                          |
|                 | P90 to P92              | I/O    | 3-bit input/output pins.                                          |
|                 | PA0 to PA7              | I/O    | 8-bit input/output pins.                                          |
|                 | PB0 to PB7              | I/O    | 8-bit input/output pins.                                          |
|                 | PC0 to PC7              | I/O    | 8-bit input/output pins.                                          |
|                 | PD0 to PD4              | I/O    | 5-bit input/output pins.                                          |
|                 | PE0 to PE7              | I/O    | 8-bit input/output pins.                                          |
|                 | PF6, PF7                | I/O    | 2-bit input/output pins.                                          |
|                 | PH7                     | Input  | 1-bit input pin.                                                  |
|                 | PJ0, PJ2, PJ3, PJ6, PJ7 | I/O    | 5-bit input/output pins.                                          |

Note 1. For external clock input.

**Table 1.6 List of Pins and Pin Functions (100-Pin TFLGA) (2/3)**

| Pin No. | Power Supply, Clock, System Control | I/O Port | Timers (MTU, POE, RTC, TMR)        | Communication (SCIE, SCIF, RSPI, RIIC, USB, SSI)                      | LCD, Touch | Others                    |
|---------|-------------------------------------|----------|------------------------------------|-----------------------------------------------------------------------|------------|---------------------------|
| D9      |                                     | PA1      | MTIOC0B/MTCLKC/RTCCOUT             | SCK5/SSLA2                                                            | SEG23      |                           |
| D10     |                                     | PA0      | MTIOC4A                            | SSLA1                                                                 | SEG24      | CACREF                    |
| E1      |                                     | P30      | MTIOC4B/POE8#/TMR13                | RXD1/SMISO1/SSCL1                                                     | CAPH       | IRQ0                      |
| E2      |                                     | P31      | MTIOC4D/TMCI2                      | CTS1#/RTS1#/SS1#                                                      | CAPL       | IRQ1                      |

|                     |                                | Deep sleep<br>mode          | No peripheral<br>operation*8               | ICLK = 32.768 kHz |          | 1.7       | —   |               |                    |
|                     |                                |                             | All peripheral operation:<br>Normal*9      | ICLK = 32.768 kHz |          | 7.0       | —   |               |                    |

Note 1. Supply current values do not include output charge/discharge current from all pins. The values apply when internal pull-up MOSs are in the off state.

Note 2. Clock supply to the peripheral functions is stopped. This does not include BGO operation. The clock source is PLL. FCLK and PCLK are set to divided by 64.

Note 3. Clocks are supplied to the peripheral functions. This does not include BGO operation. The clock source is PLL. FCLK and PCLK are set to the same frequency as ICLK.

Note 4. Values when  $\text{VCC} = 3.3\text{ V}$ .

Note 5. This is the increase for programming or erasure of the ROM or E2 DataFlash during program execution.

Note 6. Clock supply to the peripheral functions is stopped. The clock source is PLL when ICLK = 12 MHz, and HOCO otherwise. FCLK and PCLK are set to divided by 64.

Note 7. Clocks are supplied to the peripheral functions. The clock source is PLL when ICLK = 12 MHz, and HOCO otherwise. FCLK and PCLK are set to the same frequency as ICLK.

Note 8. Clock supply to the peripheral functions is stopped. The clock source is the sub-clock oscillator. FCLK and PCLK are set to divided by 64.

Note 9. Clocks are supplied to the peripheral functions. The clock source is the sub-clock oscillator. FCLK and PCLK are set to the same frequency as ICLK.

Note 10. Values when the MSTPCRA.MSTPA17 bit (12-bit A/D converter module stop bit) is set to "transition to the module stop state is made".

**Table 5.14 DC Characteristics (12)**Conditions:  $1.8\text{ V} \leq V_{CC} = V_{CC\_USB} \leq 3.6\text{ V}$ ,  $1.8\text{ V} \leq AV_{CC0} \leq 3.6\text{ V}$ ,  $V_{SS} = AV_{SS0} = V_{SS\_USB} = 0\text{ V}$ ,  $T_a = -40\text{ to }+105^\circ\text{C}$

| Maximum operating frequency | System clock (ICLK)               | $f_{\text{max}}$ | 8            | 16           | 32           | 32                | MHz  |
|                             | FlashIF clock (FCLK)*1, *2        |                  | 8            | 16           | 32           | 32                |      |
|                             | Peripheral module clock (PCLKB)   |                  | 8            | 16           | 32           | 32                |      |
|                             | Peripheral module clock (PCLKD)*3 |                  | 8            | 16           | 32           | 32                |      |
|                             | USB clock (UCLK)                  | $f_{\text{usb}}$ | —            | —            | —            | 48                |      |

Note 1. The lower-limit frequency of FCLK is 1 MHz during programming or erasing of the flash memory. When using FCLK at below 4 MHz, the frequency can be set to 1 MHz, 2 MHz, or 3 MHz. A non-integer frequency such as 1.5 MHz cannot be set.

Note 2. The frequency accuracy of FCLK should be  $\pm 3.5\%$ . Confirm the frequency accuracy of the clock source.

Note 3. The lower-limit frequency of PCLKD is 4 MHz at 2.4 V or above and 1 MHz at below 2.4 V when the A/D converter is in use.

Note 4. The VCC\_USB range is 3.0 to 3.6 V when the USB clock is in use.

| Absolute accuracy                                     |                                                           | —                  | ±3.0  | ±8.0   | LSB  |                                                                                |
| DNL differential nonlinearity error                   |                                                           | —                  | ±1.0  | —      | LSB  |                                                                                |
| INL integral nonlinearity error                       |                                                           | —                  | ±1.5  | ±3.0   | LSB  |                                                                                |

Note: The characteristics apply when no pin functions other than A/D converter input are used. Absolute accuracy includes quantization errors. Offset error, full-scale error, DNL differential nonlinearity error, and INL integral nonlinearity error do not include quantization errors.

Note 1. The conversion time is the sum of the sampling time and the comparison time. As the test conditions, the number of sampling states is indicated.

Note 2. The value in parentheses indicates the sampling time.

|                                      |                        |                        | VLCD = 12h                     | 1.6                     | 1.70                    | 1.78 | V               |
|                                      |                        |                        | VLCD = 13h                     | 1.65                    | 1.75                    | 1.83 | V               |
| Doubler output voltage               | $\text{V}_{\text{L2}}$ | C1 to C3, C5 connected | $2\text{V}_{\text{L1}} - 0.10$ | $2\text{V}_{\text{L1}}$ | $2\text{V}_{\text{L1}}$ | V    |                 |
| Tripler output voltage               | $\text{V}_{\text{L3}}$ | C1 to C5 connected     | $3\text{V}_{\text{L1}} - 0.15$ | $3\text{V}_{\text{L1}}$ | $3\text{V}_{\text{L1}}$ | V    |                 |
| Reference voltage setup time*1       | $t_{\text{VL1S}}$      |                        | 5                              | —                       | —                       | ms   |                 |
| LCD output voltage variation range*2 | $t_{\text{VLWT}}$      | C1 to C4 connected     | 500                            | —                       | —                       | ms   |                 |

Note 1. This is the required wait time from when the reference voltage is specified by the VLCD register (or when the internal voltage boosting method is selected (LCDM0.MDSET1 and MDSET0 = 01b) if the default reference voltage value is used) until voltage boosting starts (VLCON = 1).

Note 2. This is the wait time from when voltage boosting is started (VLCON = 1) until display is enabled (LCDON = 1).

## General Precautions in the Handling of Microprocessing Unit and Microcontroller Unit Products

The following usage notes are applicable to all Microprocessing unit and Microcontroller unit products from Renesas. For detailed usage notes on the products covered by this document, refer to the relevant sections of the document as well as any technical updates that have been issued for the products.

### 1. Handling of Unused Pins

Handle unused pins in accordance with the directions given under Handling of Unused Pins in the manual.

- ¾ The input pins of CMOS products are generally in the high-impedance state. In operation with an unused pin in the open-circuit state, extra electromagnetic noise is induced in the vicinity of LSI, an associated shoot-through current flows internally, and malfunctions occur due to the false recognition of the pin state as an input signal become possible. Unused pins should be handled as described under Handling of Unused Pins in the manual.

### 2. Processing at Power-on

The state of the product is undefined at the moment when power is supplied.

- ¾ The states of internal circuits in the LSI are indeterminate and the states of register settings and pins are undefined at the moment when power is supplied.  
In a finished product where the reset signal is applied to the external reset pin, the states of pins are not guaranteed from the moment when power is supplied until the reset process is completed. In a similar way, the states of pins in a product that is reset by an on-chip power-on reset function are not guaranteed from the moment when power is supplied until the power reaches the level at which resetting has been specified.

### 3. Prohibition of Access to Reserved Addresses

Access to reserved addresses is prohibited.

- ¾ The reserved addresses are provided for the possible future expansion of functions. Do not access these addresses; the correct operation of LSI is not guaranteed if they are accessed.

### 4. Clock Signals

After applying a reset, only release the reset line after the operating clock signal has become stable. When switching the clock signal during program execution, wait until the target clock signal has stabilized.

- ¾ When the clock signal is generated with an external resonator (or from an external oscillator) during a reset, ensure that the reset line is only released after full stabilization of the clock signal. Moreover, when switching to a clock signal produced with an external resonator (or by an external oscillator) while program execution is in progress, wait until the target clock signal is stable.

### 5. Differences between Products

Before changing from one product to another, i.e. to a product with a different part number, confirm that the change will not lead to problems.

- ¾ The characteristics of Microprocessing unit or Microcontroller unit products in the same group but having a different part number may differ in terms of the internal memory capacity, layout pattern, and other factors, which can affect the ranges of electrical characteristics, such as characteristic values, operating margins, immunity to noise, and amount of radiated noise. When changing to a product with a different part number, implement a system-evaluation test for the given product.
