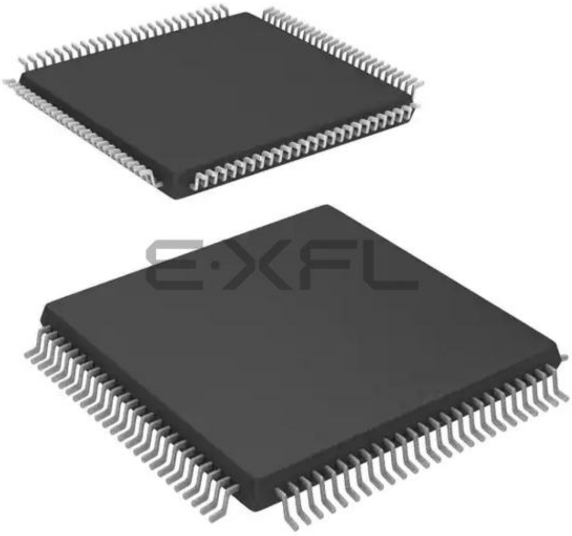
Intel - EPF8452ATC100-4N Datasheet



Welcome to E-XFL.COM

Understanding Embedded - FPGAs (Field Programmable Gate Array)

Embedded - FPGAs, or Field Programmable Gate Arrays, are advanced integrated circuits that offer unparalleled flexibility and performance for digital systems. Unlike traditional fixed-function logic devices, FPGAs can be programmed and reprogrammed to execute a wide array of logical operations, enabling customized functionality tailored to specific applications. This reprogrammability allows developers to iterate designs quickly and implement complex functions without the need for custom hardware.

Applications of Embedded - FPGAs

The versatility of Embedded - FPGAs makes them indispensable in numerous fields. In telecommunications,

Details	
Product Status	Obsolete
Number of LABs/CLBs	42
Number of Logic Elements/Cells	336
Total RAM Bits	-
Number of I/O	68
Number of Gates	4000
Voltage - Supply	4.75V ~ 5.25V
Mounting Type	Surface Mount
Operating Temperature	0°C ~ 70°C (TA)
Package / Case	100-TQFP
Supplier Device Package	100-TQFP (14x14)
Purchase URL	https://www.e-xfl.com/product-detail/intel/epf8452atc100-4n

JTAG BST circuitry	Yes	No	Yes	Yes	No	Yes

...and More Features

- Peripheral register for fast setup and clock-to-output delay
- Fabricated on an advanced SRAM process
- Available in a variety of packages with 84 to 304 pins (see Table 2)
- Software design support and automatic place-and-route provided by the Altera® MAX+PLUS® II development system for Windows-based PCs, as well as Sun SPARCstation, HP 9000 Series 700/800, and IBM RISC System/6000 workstations
- Additional design entry and simulation support provided by EDIF 2 0 0 and 3 0 0 netlist files, library of parameterized modules (LPM), Verilog HDL, VHDL, and other interfaces to popular EDA tools from manufacturers such as Cadence, Exemplar Logic, Mentor Graphics, OrCAD, Synopsys, Synplicity, and Veribest

Note:

(1) FLEX 8000 device package types include plastic J-lead chip carrier (PLCC), thin quad flat pack (TQFP), plastic quad flat pack (PQFP), power quad flat pack (RQFP), ball-grid array (BGA), and pin-grid array (PGA) packages.

General Description

Altera's Flexible Logic Element MatriX (FLEX®) family combines the benefits of both erasable programmable logic devices (EPLDs) and field-programmable gate arrays (FPGAs). The FLEX 8000 device family is ideal for a variety of applications because it combines the fine-grained architecture and high register count characteristics of FPGAs with the high speed and predictable interconnect delays of EPLDs. Logic is implemented in LEs that include compact 4-input look-up tables (LUTs) and programmable registers. High performance is provided by a fast, continuous network of routing resources.

FLEX 8000 devices contain an optimized microprocessor interface that permits the microprocessor to configure FLEX 8000 devices serially, in parallel, synchronously, or asynchronously. The interface also enables the microprocessor to treat a FLEX 8000 device as memory and configure the device by writing to a virtual memory location, making it very easy for the designer to create configuration software.

The FLEX 8000 family is supported by Altera's MAX+PLUS II development system, a single, integrated package that offers schematic, text—including the Altera Hardware Description Language (AHDL), VHDL, and Verilog HDL—and waveform design entry, compilation and logic synthesis, simulation and timing analysis, and device programming. The MAX+PLUS II software provides EDIF 2 0 0 and 3 0 0, library of parameterized modules (LPM), VHDL, Verilog HDL, and other interfaces for additional design entry and simulation support from other industry-standard PC- and UNIX workstation-based EDA tools. The MAX+PLUS II software runs on Windows-based PCs and Sun SPARCstation, HP 9000 Series 700/800, and IBM RISC System/6000 workstations.

The MAX+PLUS II software interfaces easily with common gate array EDA tools for synthesis and simulation. For example, the MAX+PLUS II software can generate Verilog HDL files for simulation with tools such as Cadence Verilog-XL. Additionally, the MAX+PLUS II software contains EDA libraries that use device-specific features such as carry chains, which are used for fast counter and arithmetic functions. For instance, the Synopsys Design Compiler library supplied with the MAX+PLUS II development system includes DesignWare functions that are optimized for the FLEX 8000 architecture.

For more information on the MAX+PLUS II software, go to the *MAX+PLUS II Programmable Logic Development System & Software Data Sheet*.

Functional Description

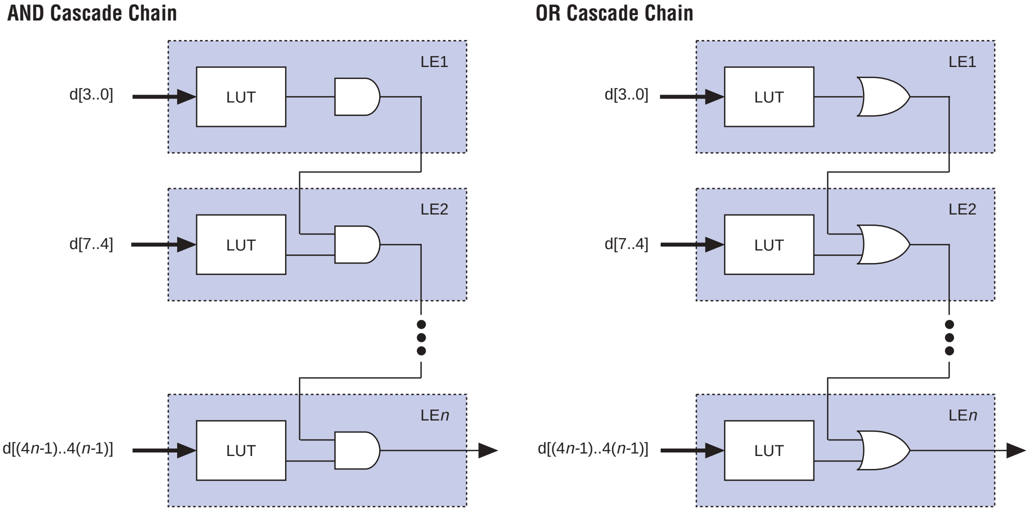
The FLEX 8000 architecture incorporates a large matrix of compact building blocks called logic elements (LEs). Each LE contains a 4-input LUT that provides combinatorial logic capability and a programmable register that offers sequential logic capability. The fine-grained structure of the LE provides highly efficient logic implementation.

Eight LEs are grouped together to form a logic array block (LAB). Each FLEX 8000 LAB is an independent structure with common inputs, interconnections, and control signals. The LAB architecture provides a coarse-grained structure for high device performance and easy routing.

The MAX+PLUS II Compiler can create cascade chains automatically during design processing; designers can also insert cascade chain logic manually during design entry. Cascade chains longer than eight LEs are automatically implemented by linking LABs together. The last LE of an LAB cascades to the first LE of the next LAB.

Figure 5 shows how the cascade function can connect adjacent LEs to form functions with a wide fan-in. These examples show functions of 4*n* variables implemented with *n* LEs. For a device with an A-2 speed grade, the LE delay is 2.4 ns; the cascade chain delay is 0.6 ns. With the cascade chain, 4.2 ns is needed to decode a 16-bit address.

Figure 5. FLEX 8000 Cascade Chain Operation



LE Operating Modes

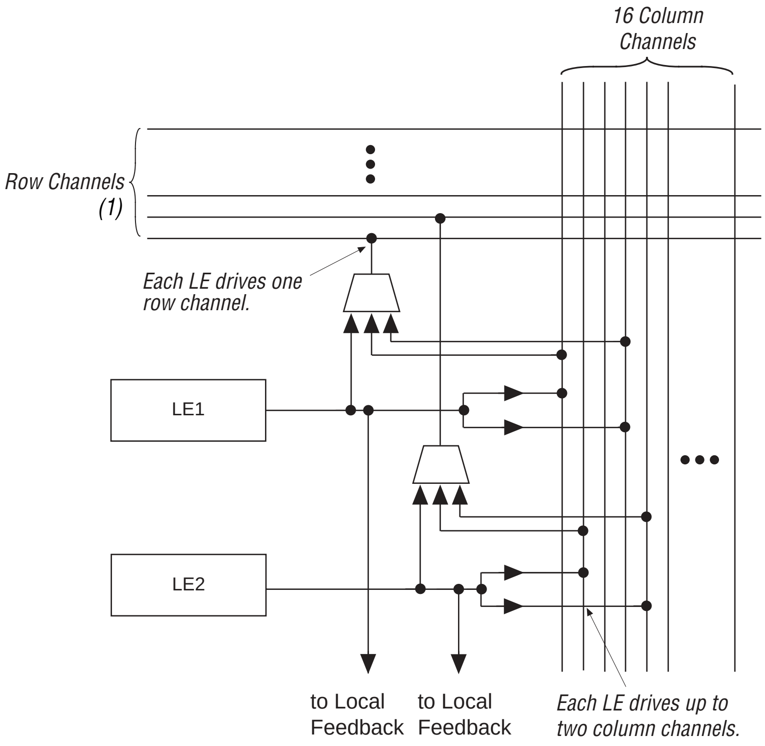
The FLEX 8000 LE can operate in one of four modes, each of which uses LE resources differently. See Figure 6. In each mode, seven of the ten available inputs to the LE—the four data inputs from the LAB local interconnect, the feedback from the programmable register, and the carry-in and cascade-in from the previous LE—are directed to different destinations to implement the desired logic function. The three remaining inputs to the LE provide clock, clear, and preset control for the register. The MAX+PLUS II software automatically chooses the appropriate mode for each application. Design performance can also be enhanced by designing for the operating mode that supports the desired application.

FastTrack Interconnect

In the FLEX 8000 architecture, connections between LEs and device I/O pins are provided by the FastTrack Interconnect, a series of continuous horizontal (row) and vertical (column) routing channels that traverse the entire FLEX 8000 device. This device-wide routing structure provides predictable performance even in complex designs. In contrast, the segmented routing structure in FPGAs requires switch matrices to connect a variable number of routing paths, which increases the delays between logic resources and reduces performance.

The LABs within FLEX 8000 devices are arranged into a matrix of columns and rows. Each row of LABs has a dedicated row interconnect that routes signals both into and out of the LABs in the row. The row interconnect can then drive I/O pins or feed other LABs in the device. Figure 8 shows how an LE drives the row and column interconnect.

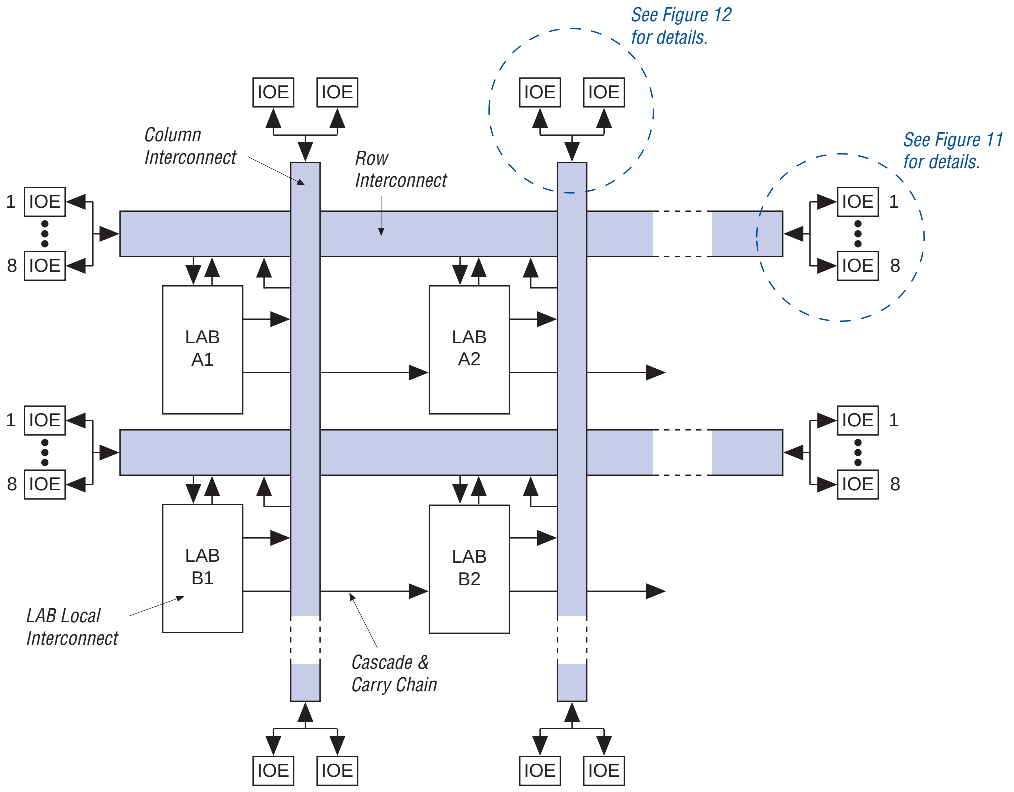
Figure 8. FLEX 8000 LAB Connections to Row & Column Interconnect



Note:
(1) See Table 4 for the number of row channels.

Figure 9. FLEX 8000 Device Interconnect Resources

Each LAB is named according to its physical row (A, B, C, etc.) and column (1, 2, 3, etc.) position within the device.

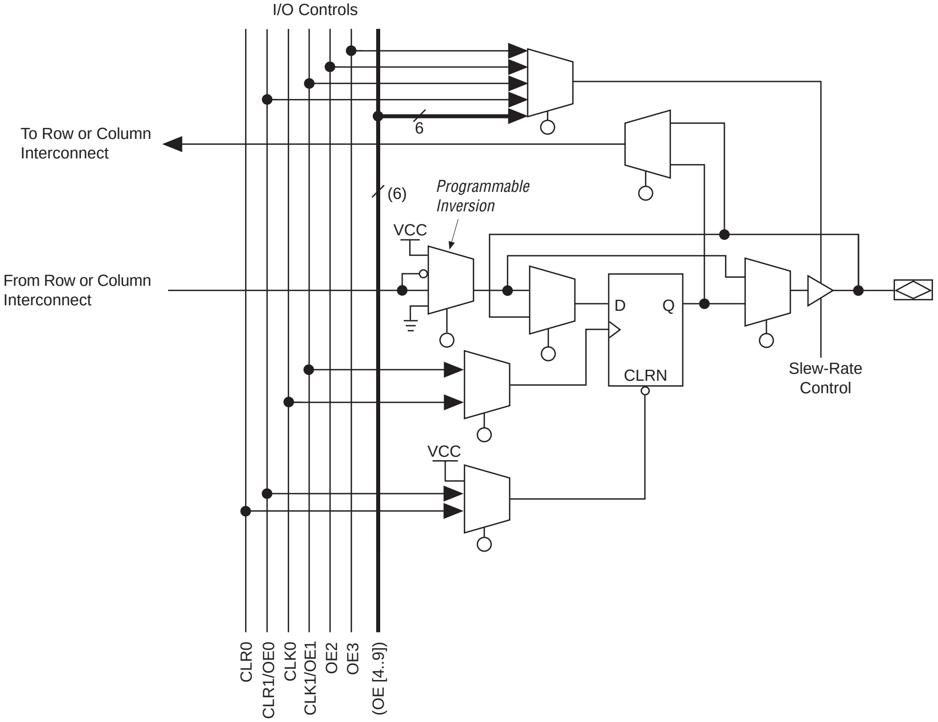


I/O Element

An IOE contains a bidirectional I/O buffer and a register that can be used either as an input register for external data that requires a fast setup time, or as an output register for data that requires fast clock-to-output performance. IOEs can be used as input, output, or bidirectional pins. The MAX+PLUS II Compiler uses the programmable inversion option to automatically invert signals from the row and column interconnect where appropriate. Figure 10 shows the IOE block diagram.

Figure 10. FLEX 8000 IOE

Numbers in parentheses are for EPF81500A devices only.



Row-to-IOE Connections

Figure 11 illustrates the connection between row interconnect channels and IOEs. An input signal from an IOE can drive two separate row channels. When an IOE is used as an output, the signal is driven by an *n*-to-1 multiplexer that selects the row channels. The size of the multiplexer varies with the number of columns in a device. EPF81500A devices use a 27-to-1 multiplexer; EPF81188A, EPF8820A, EPF8636A, and EPF8452A devices use a 21-to-1 multiplexer; and EPF8282A and EPF8282AV devices use a 13-to-1 multiplexer. Eight IOEs are connected to each side of the row channels.

Table 8. JTAG Timing Parameters & Values

Symbol	Parameter	EPF8282A EPF8282AV EPF8636A EPF8820A EPF81500A		Unit
		Min	Max	
t_{JCP}	TCK clock period	100		ns
t_{JCH}	TCK clock high time	50		ns
t_{JCL}	TCK clock low time	50		ns
t_{JPSU}	JTAG port setup time	20		ns
t_{JPH}	JTAG port hold time	45		ns
t_{JPCO}	JTAG port clock to output		25	ns
t_{JPZX}	JTAG port high-impedance to valid output		25	ns
t_{JPXZ}	JTAG port valid output to high-impedance		25	ns
t_{JSSU}	Capture register setup time	20		ns
t_{JSH}	Capture register hold time	45		ns
t_{JSCO}	Update register clock to output		35	ns
t_{JSZX}	Update register high-impedance to valid output		35	ns
t_{JSXZ}	Update register valid output to high-impedance		35	ns

For detailed information on JTAG operation in FLEX 8000 devices, refer to *Application Note 39 (IEEE 1149.1 (JTAG) Boundary-Scan Testing in Altera Devices)*.

Generic Testing

Each FLEX 8000 device is functionally tested and specified by Altera. Complete testing of each configurable SRAM bit and all logic functionality ensures 100% configuration yield. AC test measurements for FLEX 8000 devices are made under conditions equivalent to those shown in Figure 15. Designers can use multiple test patterns to configure devices during all stages of the production flow.

Table 10. FLEX 8000 5.0-V Device Recommended Operating Conditions

Symbol	Parameter	Conditions	Min	Max	Unit
V_{CCINT}	Supply voltage for internal logic and input buffers	(3), (4)	4.75 (4.50)	5.25 (5.50)	V
V_{CCIO}	Supply voltage for output buffers, 5.0-V operation	(3), (4)	4.75 (4.50)	5.25 (5.50)	V
	Supply voltage for output buffers, 3.3-V operation	(3), (4)	3.00 (3.00)	3.60 (3.60)	V
V_I	Input voltage		–0.5	V_{CCINT} + 0.5	V
V_O	Output voltage		0	V_{CCIO}	V
T_A	Operating temperature	For commercial use	0	70	° C
		For industrial use	–40	85	° C
t_R	Input rise time			40	ns
t_F	Input fall time			40	ns

Table 11. FLEX 8000 5.0-V Device DC Operating Conditions *Notes (5), (6)*

Symbol	Parameter	Conditions	Min	Typ	Max	Unit
V_{IH}	High-level input voltage		2.0		V_{CCINT} + 0.5	V
V_{IL}	Low-level input voltage		–0.5		0.8	V
V_{OH}	5.0-V high-level TTL output voltage	I_{OH} = –4 mA DC (7) V_{CCIO} = 4.75 V	2.4			V
	3.3-V high-level TTL output voltage	I_{OH} = –4 mA DC (7) V_{CCIO} = 3.00 V	2.4			V
	3.3-V high-level CMOS output voltage	I_{OH} = –0.1 mA DC (7) V_{CCIO} = 3.00 V	V_{CCIO} – 0.2			V
V_{OL}	5.0-V low-level TTL output voltage	I_{OL} = 12 mA DC (7) V_{CCIO} = 4.75 V			0.45	V
	3.3-V low-level TTL output voltage	I_{OL} = 12 mA DC (7) V_{CCIO} = 3.00 V			0.45	V
	3.3-V low-level CMOS output voltage	I_{OL} = 0.1 mA DC (7) V_{CCIO} = 3.00 V			0.2	V
I_I	Input leakage current	V_I = V_{CC} or ground	–10		10	μA
I_{OZ}	Tri-state output off-state current	V_O = V_{CC} or ground	–40		40	μA
I_{CC0}	V_{CC} supply current (standby)	V_I = ground, no load		0.5	10	mA

Table 12. FLEX 8000 5.0-V Device Capacitance *Note (8)*

Symbol	Parameter	Conditions	Min	Max	Unit
C_{IN}	Input capacitance	V_{IN} = 0 V, f = 1.0 MHz		10	pF
C_{OUT}	Output capacitance	V_{OUT} = 0 V, f = 1.0 MHz		10	pF

Notes to tables:

(1) See the *Operating Requirements for Altera Devices Data Sheet*.
(2) Minimum DC input is –0.5 V. During transitions, the inputs may undershoot to –2.0 V or overshoot to 7.0 V for input currents less than 100 mA and periods shorter than 20 ns.
(3) The maximum V_{CC} rise time is 100 ms.
(4) Numbers in parentheses are for industrial-temperature-range devices.
(5) Typical values are for T_A = 25° C and V_{CC} = 5.0 V.
(6) These values are specified in Table 10 on page 28.
(7) The I_{OH} parameter refers to high-level TTL or CMOS output current; the I_{OL} parameter refers to low-level TTL or CMOS output current.
(8) Capacitance is sample-tested only.

Tables 13 through 16 provide information on absolute maximum ratings, recommended operating conditions, operating conditions, and capacitance for 3.3-V FLEX 8000 devices.

Table 13. FLEX 8000 3.3-V Device Absolute Maximum Ratings *Note (1)*

Symbol	Parameter	Conditions	Min	Max	Unit
V_{CC}	Supply voltage	With respect to ground *(2)*	–2.0	5.3	V
V_I	DC input voltage		–2.0	5.3	V
I_{OUT}	DC output current, per pin		–25	25	mA
T_{STG}	Storage temperature	No bias	–65	150	° C
T_{AMB}	Ambient temperature	Under bias	–65	135	° C
T_J	Junction temperature	Plastic packages, under bias		135	° C

Table 14. FLEX 8000 3.3-V Device Recommended Operating Conditions

Symbol	Parameter	Conditions	Min	Max	Unit
V_{CC}	Supply voltage	*(3)*	3.0	3.6	V
V_I	Input voltage		–0.3	V_{CC} + 0.3	V
V_O	Output voltage		0	V_{CC}	V
T_A	Operating temperature	For commercial use	0	70	° C
t_R	Input rise time			40	ns
t_F	Input fall time			40	ns

Figure 16. Output Drive Characteristics of 5.0-V FLEX 8000 Devices (Except EPF8282A)

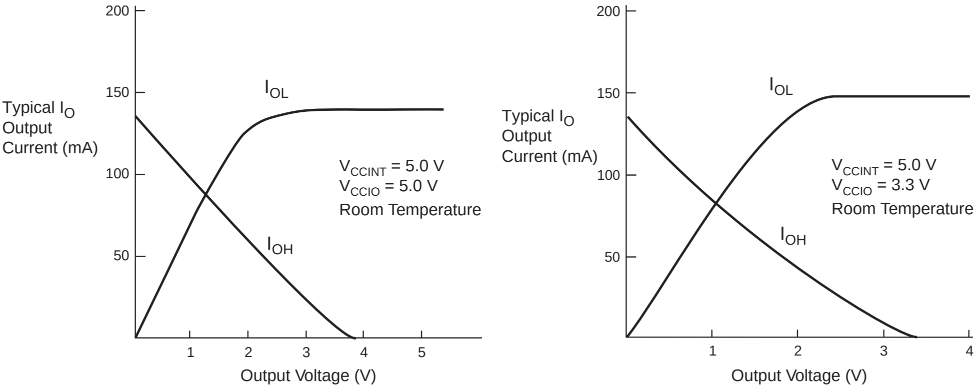


Figure 17 shows the typical output drive characteristics of 5.0-V EPF8282A devices. The output driver is compliant with ***PCI Local Bus Specification, Revision 2.2***.

Figure 17. Output Drive Characteristics of EPF8282A Devices with 5.0-V V_{CCIO}

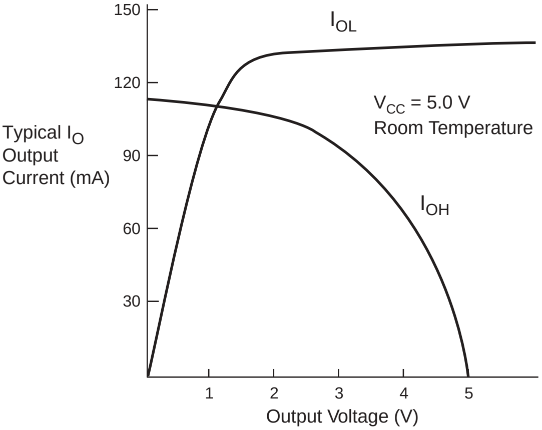

Figure 18 shows the typical output drive characteristics of EPF8282AV devices.

Table 17. FLEX 8000 Internal Timing Parameters *Note (1)*
