Welcome to E-XFL.COM

Understanding Embedded - FPGAs (Field Programmable Gate Array)

Embedded - FPGAs, or Field Programmable Gate Arrays, are advanced integrated circuits that offer unparalleled flexibility and performance for digital systems. Unlike traditional fixed-function logic devices, FPGAs can be programmed and reprogrammed to execute a wide array of logical operations, enabling customized functionality tailored to specific applications. This reprogrammability allows developers to iterate designs quickly and implement complex functions without the need for custom hardware.

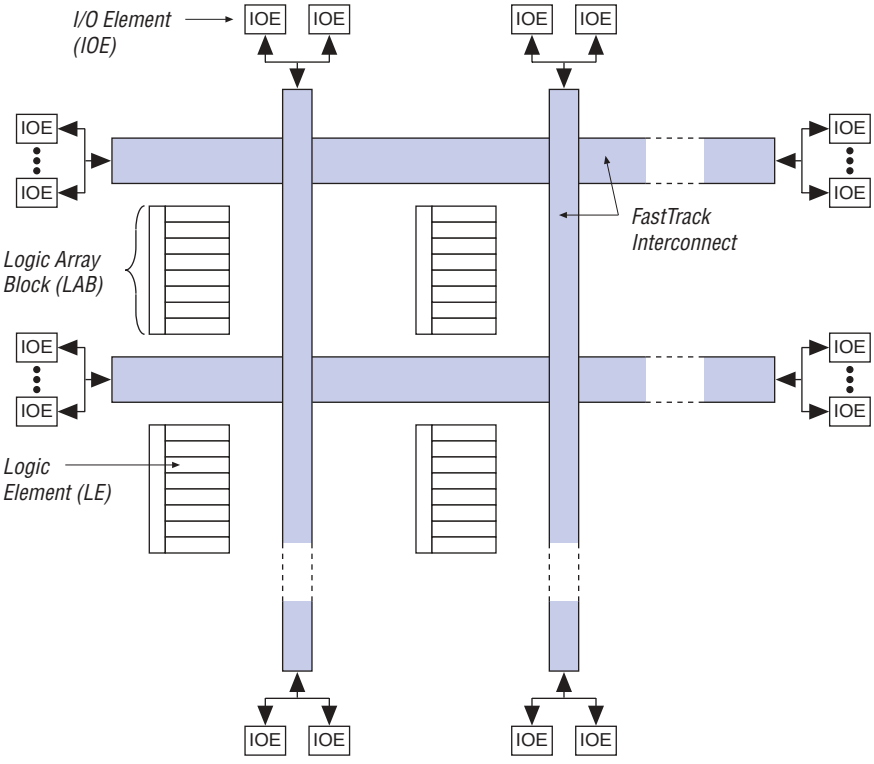
Applications of Embedded - FPGAs

The versatility of Embedded - FPGAs makes them indispensable in numerous fields. In telecommunications.

Details	
Product Status	Obsolete
Number of LABs/CLBs	63
Number of Logic Elements/Cells	504
Total RAM Bits	-
Number of I/O	118
Number of Gates	6000
Voltage - Supply	4.75V ~ 5.25V
Mounting Type	Surface Mount
Operating Temperature	0°C ~ 70°C (TA)
Package / Case	160-BQFP
Supplier Device Package	160-PQFP (28x28)
Purchase URL	https://www.e-xfl.com/product-detail/intel/epf8636aqc160-4n

Figure 1 shows a block diagram of the FLEX 8000 architecture. Each group of eight LEs is combined into an LAB; LABs are arranged into rows and columns. The I/O pins are supported by I/O elements (IOEs) located at the ends of rows and columns. Each IOE contains a bidirectional I/O buffer and a flipflop that can be used as either an input or output register.

Figure 1. FLEX 8000 Device Block Diagram

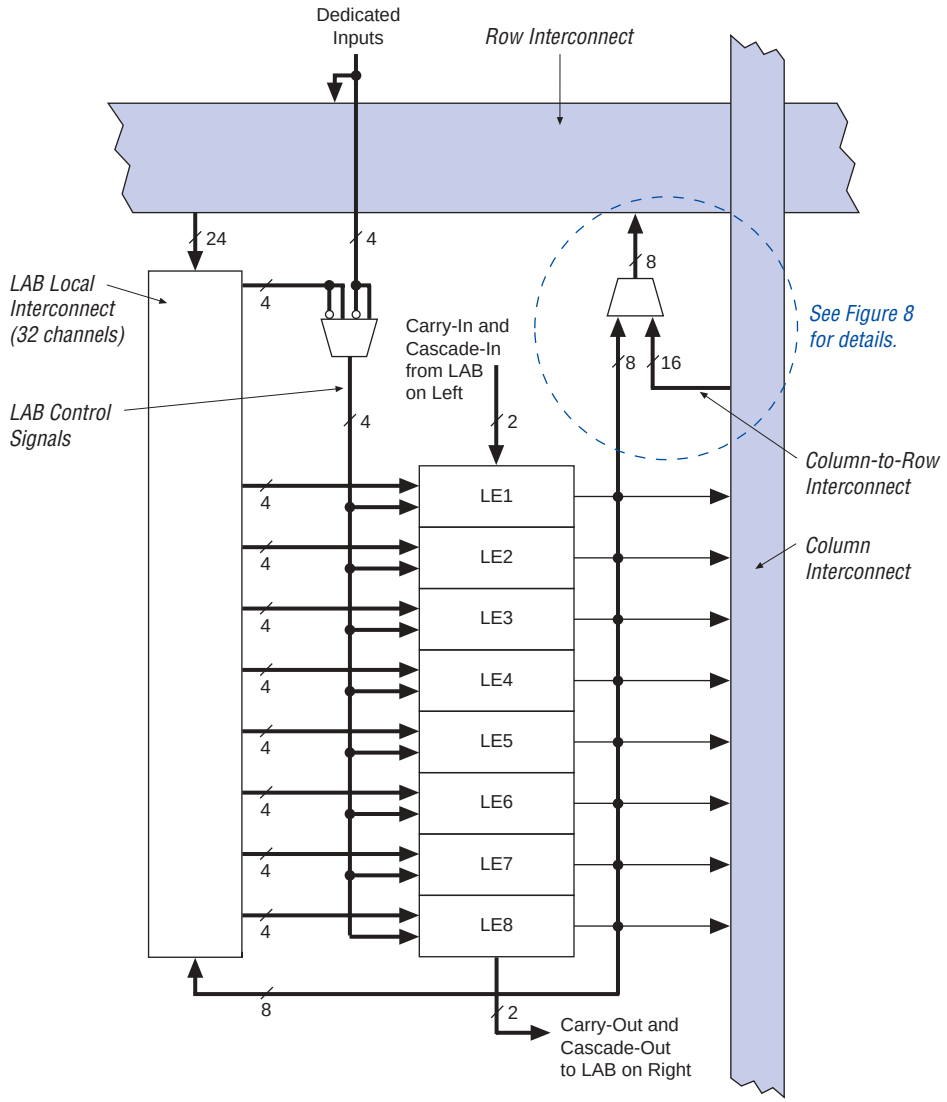


Signal interconnections within FLEX 8000 devices and between device pins are provided by the FastTrack Interconnect, a series of fast, continuous channels that run the entire length and width of the device. IOEs are located at the end of each row (horizontal) and column (vertical) FastTrack Interconnect path.

Logic Array Block

A logic array block (LAB) consists of eight LEs, their associated carry and cascade chains, LAB control signals, and the LAB local interconnect. The LAB provides the coarse-grained structure of the FLEX 8000 architecture. This structure enables FLEX 8000 devices to provide efficient routing, high device utilization, and high performance. Figure 2 shows a block diagram of the FLEX 8000 LAB.

Figure 2. FLEX 8000 Logic Array Block

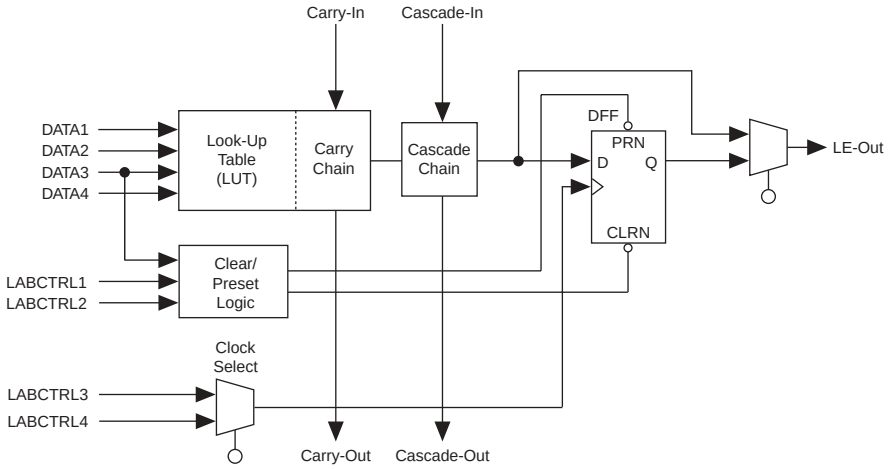


Each LAB provides four control signals that can be used in all eight LEs. Two of these signals can be used as clocks, and the other two for clear/preset control. The LAB control signals can be driven directly from a dedicated input pin, an I/O pin, or any internal signal via the LAB local interconnect. The dedicated inputs are typically used for global clock, clear, or preset signals because they provide synchronous control with very low skew across the device. FLEX 8000 devices support up to four individual global clock, clear, or preset control signals. If logic is required on a control signal, it can be generated in one or more LEs in any LAB and driven into the local interconnect of the target LAB.

Logic Element

The logic element (LE) is the smallest unit of logic in the FLEX 8000 architecture, with a compact size that provides efficient logic utilization. Each LE contains a 4-input LUT, a programmable flipflop, a carry chain, and cascade chain. Figure 3 shows a block diagram of an LE.

Figure 3. FLEX 8000 LE



The LUT is a function generator that can quickly compute any function of four variables. The programmable flipflop in the LE can be configured for D, T, JK, or SR operation. The clock, clear, and preset control signals on the flipflop can be driven by dedicated input pins, general-purpose I/O pins, or any internal logic. For purely combinatorial functions, the flipflop is bypassed and the output of the LUT goes directly to the output of the LE.

The FLEX 8000 architecture provides two dedicated high-speed data paths—carry chains and cascade chains—that connect adjacent LEs without using local interconnect paths. The carry chain supports high-speed counters and adders; the cascade chain implements wide-input functions with minimum delay. Carry and cascade chains connect all LEs in an LAB and all LABs in the same row. Heavy use of carry and cascade chains can reduce routing flexibility. Therefore, the use of carry and cascade chains should be limited to speed-critical portions of a design.

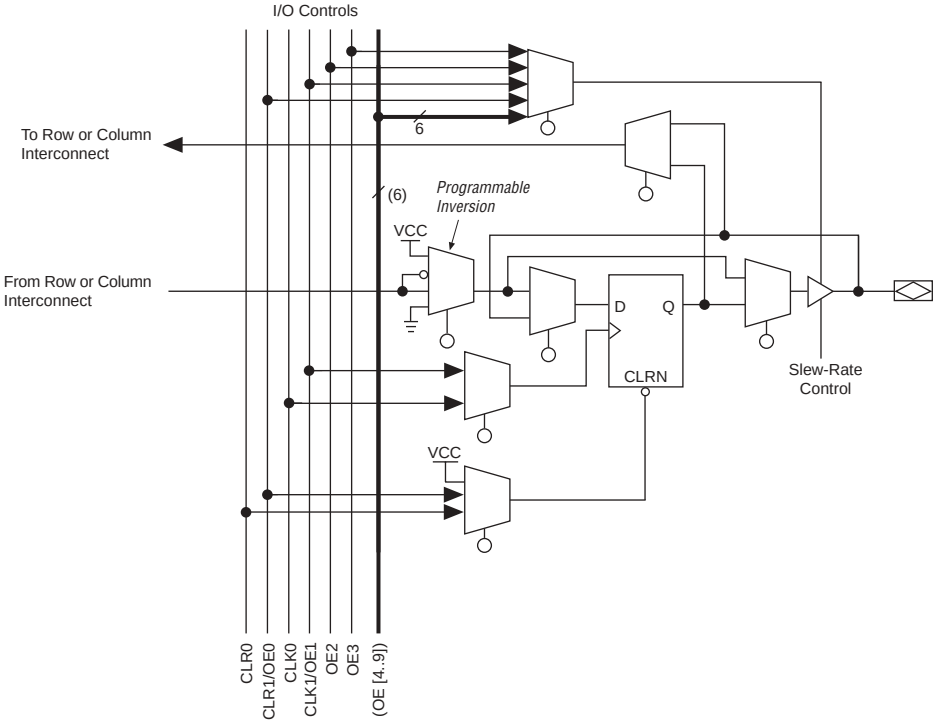
Carry Chain

The carry chain provides a very fast (less than 1 ns) carry-forward function between LEs. The carry-in signal from a lower-order bit moves forward into the higher-order bit via the carry chain, and feeds into both the LUT and the next portion of the carry chain. This feature allows the FLEX 8000 architecture to implement high-speed counters and adders of arbitrary width. The MAX+PLUS II Compiler can create carry chains automatically during design processing; designers can also insert carry chain logic manually during design entry.

Figure 4 shows how an *n*-bit full adder can be implemented in *n* + 1 LEs with the carry chain. One portion of the LUT generates the sum of two bits using the input signals and the carry-in signal; the sum is routed to the output of the LE. The register is typically bypassed for simple adders, but can be used for an accumulator function. Another portion of the LUT and the carry chain logic generate the carry-out signal, which is routed directly to the carry-in signal of the next-higher-order bit. The final carry-out signal is routed to another LE, where it can be used as a general-purpose signal. In addition to mathematical functions, carry chain logic supports very fast counters and comparators.

Figure 10. FLEX 8000 IOE

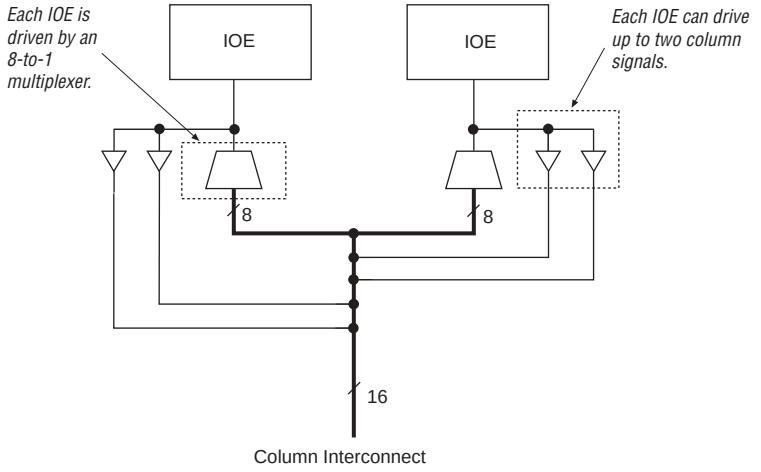
Numbers in parentheses are for EPF81500A devices only.



Row-to-IOE Connections

Figure 11 illustrates the connection between row interconnect channels and IOEs. An input signal from an IOE can drive two separate row channels. When an IOE is used as an output, the signal is driven by an *n*-to-1 multiplexer that selects the row channels. The size of the multiplexer varies with the number of columns in a device. EPF81500A devices use a 27-to-1 multiplexer; EPF81188A, EPF8820A, EPF8636A, and EPF8452A devices use a 21-to-1 multiplexer; and EPF8282A and EPF8282AV devices use a 13-to-1 multiplexer. Eight IOEs are connected to each side of the row channels.

Figure 12. FLEX 8000 Column-to-IOE Connections



In addition to general-purpose I/O pins, FLEX 8000 devices have four dedicated input pins. These dedicated inputs provide low-skew, device-wide signal distribution, and are typically used for global clock, clear, and preset control signals. The signals from the dedicated inputs are available as control signals for all LABs and I/O elements in the device. The dedicated inputs can also be used as general-purpose data inputs because they can feed the local interconnect of each LAB in the device.

Signals enter the FLEX 8000 device either from the I/O pins that provide general-purpose input capability or from the four dedicated inputs. The IOEs are located at the ends of the row and column interconnect channels.

I/O pins can be used as input, output, or bidirectional pins. Each I/O pin has a register that can be used either as an input register for external data that requires fast setup times, or as an output register for data that requires fast clock-to-output performance. The MAX+PLUS II Compiler uses the programmable inversion option to invert signals automatically from the row and column interconnect when appropriate.

The clock, clear, and output enable controls for the IOEs are provided by a network of I/O control signals. These signals can be supplied by either the dedicated input pins or by internal logic. The IOE control-signal paths are designed to minimize the skew across the device. All control-signal sources are buffered onto high-speed drivers that drive the signals around the periphery of the device. This "peripheral bus" can be configured to provide up to four output enable signals (10 in EPF81500A devices), and up to two clock or clear signals. Figure 13 on page 22 shows how two output enable signals are shared with one clock and one clear signal.

Table 8. JTAG Timing Parameters & Values

Symbol	Parameter	EPF8282A EPF8282AV EPF8636A EPF8820A EPF81500A		Unit
		Min	Max	
t_{JCP}	TCK clock period	100		ns
t_{JCH}	TCK clock high time	50		ns
t_{JCL}	TCK clock low time	50		ns
t_{JPSU}	JTAG port setup time	20		ns
t_{JPH}	JTAG port hold time	45		ns
t_{JPCO}	JTAG port clock to output		25	ns
t_{JPZX}	JTAG port high-impedance to valid output		25	ns
t_{JPXZ}	JTAG port valid output to high-impedance		25	ns
t_{JSSU}	Capture register setup time	20		ns
t_{JSH}	Capture register hold time	45		ns
t_{JSCO}	Update register clock to output		35	ns
t_{JSZX}	Update register high-impedance to valid output		35	ns
t_{JSXZ}	Update register valid output to high-impedance		35	ns

For detailed information on JTAG operation in FLEX 8000 devices, refer to *Application Note 39 (IEEE 1149.1 (JTAG) Boundary-Scan Testing in Altera Devices)*.

Generic Testing

Each FLEX 8000 device is functionally tested and specified by Altera. Complete testing of each configurable SRAM bit and all logic functionality ensures 100% configuration yield. AC test measurements for FLEX 8000 devices are made under conditions equivalent to those shown in Figure 15. Designers can use multiple test patterns to configure devices during all stages of the production flow.

Table 10. FLEX 8000 5.0-V Device Recommended Operating Conditions

Symbol	Parameter	Conditions	Min	Max	Unit
V_{CCINT}	Supply voltage for internal logic and input buffers	*(3)*, *(4)*	4.75 (4.50)	5.25 (5.50)	V
V_{CCIO}	Supply voltage for output buffers, 5.0-V operation	*(3)*, *(4)*	4.75 (4.50)	5.25 (5.50)	V
	Supply voltage for output buffers, 3.3-V operation	*(3)*, *(4)*	3.00 (3.00)	3.60 (3.60)	V
V_I	Input voltage		–0.5	V_{CCINT} + 0.5	V
V_O	Output voltage		0	V_{CCIO}	V
T_A	Operating temperature	For commercial use	0	70	° C
		For industrial use	–40	85	° C
t_R	Input rise time			40	ns
t_F	Input fall time			40	ns

Table 11. FLEX 8000 5.0-V Device DC Operating Conditions *Notes (5), (6)*

Symbol	Parameter	Conditions	Min	Typ	Max	Unit
V_{IH}	High-level input voltage		2.0		V_{CCINT} + 0.5	V
V_{IL}	Low-level input voltage		–0.5		0.8	V
V_{OH}	5.0-V high-level TTL output voltage	I_{OH} = –4 mA DC *(7)* V_{CCIO} = 4.75 V	2.4			V
	3.3-V high-level TTL output voltage	I_{OH} = –4 mA DC *(7)* V_{CCIO} = 3.00 V	2.4			V
	3.3-V high-level CMOS output voltage	I_{OH} = –0.1 mA DC *(7)* V_{CCIO} = 3.00 V	V_{CCIO} – 0.2			V
V_{OL}	5.0-V low-level TTL output voltage	I_{OL} = 12 mA DC *(7)* V_{CCIO} = 4.75 V			0.45	V
	3.3-V low-level TTL output voltage	I_{OL} = 12 mA DC *(7)* V_{CCIO} = 3.00 V			0.45	V
	3.3-V low-level CMOS output voltage	I_{OL} = 0.1 mA DC *(7)* V_{CCIO} = 3.00 V			0.2	V
I_I	Input leakage current	V_I = V_{CC} or ground	–10		10	µA
I_{OZ}	Tri-state output off-state current	V_O = V_{CC} or ground	–40		40	µA
I_{CC0}	V_{CC} supply current (standby)	V_I = ground, no load		0.5	10	mA

Table 12. FLEX 8000 5.0-V Device Capacitance *Note (8)*

Symbol	Parameter	Conditions	Min	Max	Unit
C_{IN}	Input capacitance	V_{IN} = 0 V, f = 1.0 MHz		10	pF
C_{OUT}	Output capacitance	V_{OUT} = 0 V, f = 1.0 MHz		10	pF

Notes to tables:

(1) See the *Operating Requirements for Altera Devices Data Sheet*.
(2) Minimum DC input is –0.5 V. During transitions, the inputs may undershoot to –2.0 V or overshoot to 7.0 V for input currents less than 100 mA and periods shorter than 20 ns.
(3) The maximum V_{CC} rise time is 100 ms.
(4) Numbers in parentheses are for industrial-temperature-range devices.
(5) Typical values are for T_A = 25° C and V_{CC} = 5.0 V.
(6) These values are specified in Table 10 on page 28.
(7) The I_{OH} parameter refers to high-level TTL or CMOS output current; the I_{OL} parameter refers to low-level TTL or CMOS output current.
(8) Capacitance is sample-tested only.

Tables 13 through 16 provide information on absolute maximum ratings, recommended operating conditions, operating conditions, and capacitance for 3.3-V FLEX 8000 devices.

Table 13. FLEX 8000 3.3-V Device Absolute Maximum Ratings *Note (1)*

Symbol	Parameter	Conditions	Min	Max	Unit
V_{CC}	Supply voltage	With respect to ground *(2)*	–2.0	5.3	V
V_I	DC input voltage		–2.0	5.3	V
I_{OUT}	DC output current, per pin		–25	25	mA
T_{STG}	Storage temperature	No bias	–65	150	° C
T_{AMB}	Ambient temperature	Under bias	–65	135	° C
T_J	Junction temperature	Plastic packages, under bias		135	° C

Table 14. FLEX 8000 3.3-V Device Recommended Operating Conditions

Symbol	Parameter	Conditions	Min	Max	Unit
V_{CC}	Supply voltage	*(3)*	3.0	3.6	V
