What is "[Embedded - Microcontrollers](#)"?

"[Embedded - Microcontrollers](#)" refer to small, integrated circuits designed to perform specific tasks within larger systems. These microcontrollers are essentially compact computers on a single chip, containing a processor core, memory, and programmable input/output peripherals. They are called "embedded" because they are embedded within electronic devices to control various functions, rather than serving as standalone computers. Microcontrollers are crucial in modern electronics, providing the intelligence and control needed for a wide range of applications.

Details

Product Status	Not For New Designs
Core Processor	STM8A
Core Size	8-Bit
Speed	24MHz
Connectivity	CANbus, I ² C, LINbus, SPI, UART/USART
Peripherals	Brown-out Detect/Reset, POR, PWM, WDT
Number of I/O	38
Program Memory Size	64KB (64K x 8)
Program Memory Type	FLASH
EEPROM Size	2K x 8
RAM Size	6K x 8
Voltage - Supply (Vcc/Vdd)	3V ~ 5.5V
Data Converters	A/D 10x10b
Oscillator Type	Internal
Operating Temperature	-40°C ~ 85°C (TA)
Mounting Type	Surface Mount
Package / Case	48-LQFP
Supplier Device Package	48-LQFP (7x7)

5.8 Analog to digital converter (ADC)

The STM8A products described in this datasheet contain a 10-bit successive approximation ADC with up to 16 multiplexed input channels, depending on the package.

The ADC name differs between the datasheet and the STM8A/S reference manual (see [Table 8](#)).

Table 8. ADC naming

Peripheral name in datasheet	Peripheral name in reference manual (RM0016)
ADC	ADC2

ADC features

- 10-bit resolution
- Single and continuous conversion modes
- Programmable prescaler: f_{MASTER} divided by 2 to 18
- Conversion trigger on timer events, and external events
- Interrupt generation at end of conversion
- Selectable alignment of 10-bit data in 2 x 8 bit result registers
- Shadow registers for data consistency
- ADC input range: $V_{SSA} \leq V_{IN} \leq V_{DDA}$
- Schmitt-trigger on analog inputs can be disabled to reduce power consumption

5.9 Communication interfaces

The following sections give a brief overview of the communication peripheral. Some peripheral names differ between the datasheet and STM8S series and STM8AF series 8-bit microcontrollers reference manual (see [Table 9](#)).

Table 9. Communication peripheral naming correspondence

Peripheral name in datasheet	Peripheral name in reference manual (RM0016)
USART	UART1
LINUART	UART3

5.9.1 Universal synchronous/asynchronous receiver transmitter (USART)

The devices covered by this datasheet contain one USART interface. The USART can operate in standard SCI mode (serial communication interface, asynchronous) or in SPI emulation mode. It is equipped with a 16 bit fractional prescaler. It features LIN master support.

- Interrupt:
 - Successful address/data communication
 - Error condition
 - Wakeup from Halt
- Wakeup from Halt on address detection in slave mode

5.9.5 Controller area network interface (beCAN)

The beCAN controller (basic enhanced CAN), interfaces the CAN network and supports the CAN protocol version 2.0A and B. It is equipped with a receive FIFO and a very versatile filter bank. Together with a filter match index, this allows a very efficient message handling in today's car network architectures. The CPU is significantly unloaded. The maximum transmission speed is 1 Mbit/s.

Transmission

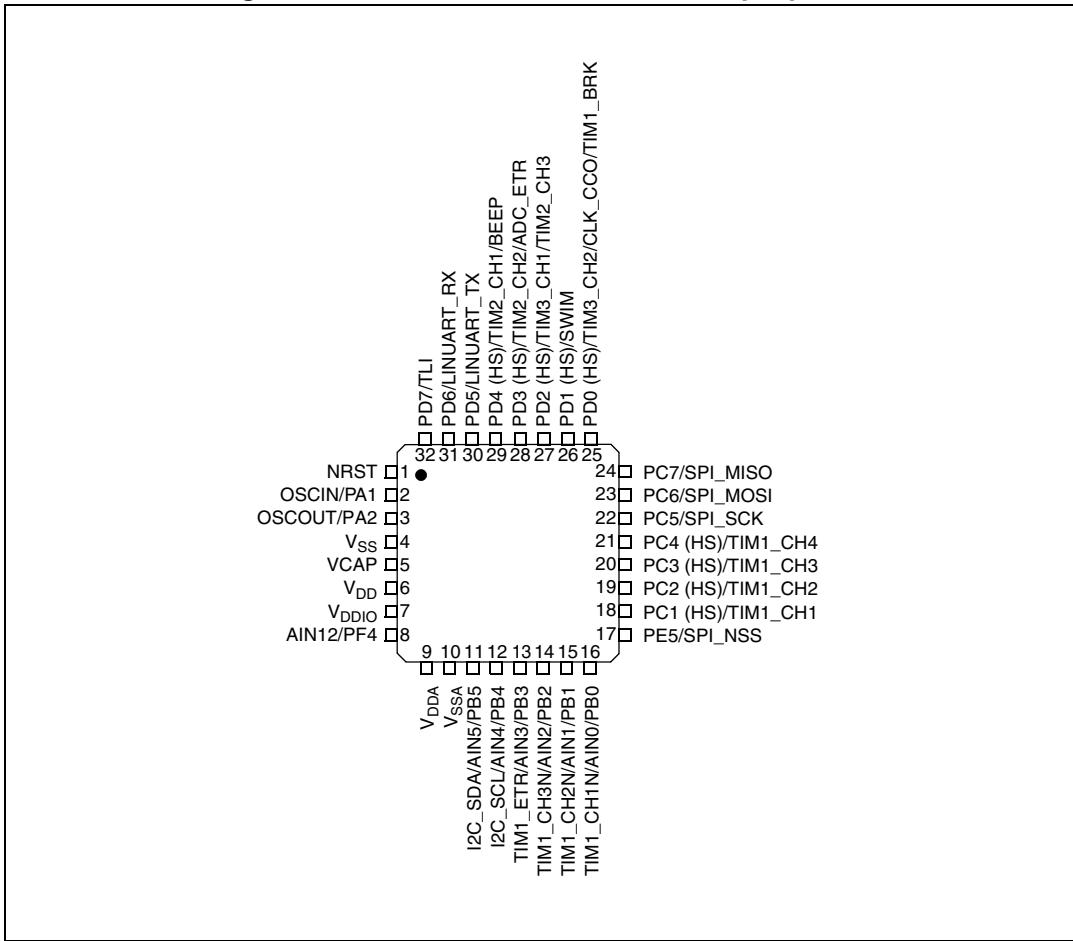

- Three transmit mailboxes
- Configurable transmit priority by identifier or order request

Reception

- 11- and 29-bit ID
- 1 receive FIFO (3 messages deep)
- Software-efficient mailbox mapping at a unique address space
- FMI (filter match index) stored with message for quick message association
- Configurable FIFO overrun
- Time stamp on SOF reception
- 6 filter banks, 2 x 32 bytes (scalable to 4 x 16-bit) each, enabling various masking configurations, such as 12 filters for 29-bit ID or 48 filters for 11-bit ID.
- Filtering modes (mixable):
 - Mask mode permitting ID range filtering
 - ID list mode

Interrupt management

- Maskable interrupt
- Software-efficient mailbox mapping at a unique address space

 2. The ideal transfer curve
 3. End point correlation line
- E_T** = Total unadjusted error: Maximum deviation between the actual and the ideal transfer curves.
 E_O = Offset error: Deviation between the first actual transition and the first ideal one.
 E_G = Gain error: Deviation between the last ideal transition and the last actual one.
 E_D = Differential linearity error: Maximum deviation between actual steps and the ideal one.
 E_L = Integral linearity error: Maximum deviation between any actual transition and the end point correlation line.

Device marking

The following figure gives an example of topside marking orientation versus pin 1 identifier location.

Other optional marking or inset/upset marks, which identify the parts throughout supply chain operations, are not indicated below.

1. Parts marked as "ES", "E" or accompanied by an Engineering Sample notification letter are not yet qualified and therefore not approved for use in production. ST is not responsible for any consequences resulting from such use. In no event will ST be liable for the customer using any of these engineering samples in production. ST's quality department must be contacted to run a qualification activity prior to any decision to use these engineering samples.

11.6 Thermal characteristics

In case the maximum chip junction temperature (T_{Jmax}) specified in [Table 24: General operating conditions](#) is exceeded, the functionality of the device cannot be guaranteed.

T_{Jmax} , in degrees Celsius, may be calculated using the following equation:

$$T_{Jmax} = T_{Amax} + (P_{Dmax} \times \Theta_{JA})$$

where:

T_{Amax} is the maximum ambient temperature in °C

Θ_{JA} is the package junction-to-ambient thermal resistance in °C/W

P_{Dmax} is the sum of P_{INTmax} and $P_{I/Omax}$ ($P_{Dmax} = P_{INTmax} + P_{I/Omax}$)

P_{INTmax} is the product of I_{DD} and V_{DD} , expressed in Watts. This is the maximum chip internal power.

$P_{I/Omax}$ represents the maximum power dissipation on output pins

where:

$$P_{I/Omax} = \sum (V_{OL} * I_{OL}) + \sum ((V_{DD} - V_{OH}) * I_{OH})$$

taking into account the actual V_{OL} / I_{OL} and V_{OH} / I_{OH} of the I/Os at low- and high-level in the application.
