What is "Embedded - Microcontrollers"?

"Embedded - Microcontrollers" refer to small, integrated circuits designed to perform specific tasks within larger systems. These microcontrollers are essentially compact computers on a single chip, containing a processor core, memory, and programmable input/output peripherals. They are called "embedded" because they are embedded within electronic devices to control various functions, rather than serving as standalone computers. Microcontrollers are crucial in modern electronics, providing the intelligence and control needed for a wide range of applications.

1. The following I/O ports are not automatically configured by hardware: PA3, PA4, PA5, PA6, PF4, PB6, PB7, PE0, PE1, PE2, PE3, PE6, PE7. As a consequence, they must be put into one of the following configurations by software:
   - configured as input with internal pull-up/down resistor,
   - configured as output push-pull low.
2. HS stands for high sink capability.

Table 10. Legend/abbreviation for the pin description table

Type	I= input, O = output, S = power supply	
Level	Input	CM = CMOS (standard for all I/Os)
	Output	HS = high sink (8 mA)
Output speed	O1 = Standard (up to 2 MHz) O2 = Fast (up to 10 MHz) O3 = Fast/slow programmability with slow as default state after reset O4 = Fast/slow programmability with fast as default state after reset	
Port and control configuration	Input	float = floating, wpu = weak pull-up
	Output	T = true open drain, OD = open drain, PP = push pull
Reset state	Bold X (pin state after reset release). Unless otherwise specified, the pin state is the same during the reset phase (i.e. “under reset”) and after internal reset release (i.e. at reset state).

1. In Halt/Active-halt mode, this pin behaves as follows:
   - The input/output path is disabled.
   - If the HSE clock is used for wakeup, the internal weak pull-up is disabled.
   - If the HSE clock is off, the internal weak pull-up setting is used. It is configured through Px_CR1[7:0] bits of the corresponding port control register. Px_CR1[7:0] bits must be set correctly to ensure that the pin is not left floating in Halt/Active-halt mode.
2. SPI and USTART are not available in STM8AF5286UC, refer to *Figure 7: STM8AF52x6 VFQFPN32 32-pin pinout* for the pin names.
3. In the open-drain output column, 'T' defines a true open-drain I/O (P-buffer, week pull-up and protection diode to V_{DD} are not implemented)
4. The PD1 pin is in input pull-up during the reset phase and after reset release.
5. If this pin is configured as interrupt pin, it will trigger the TLI.

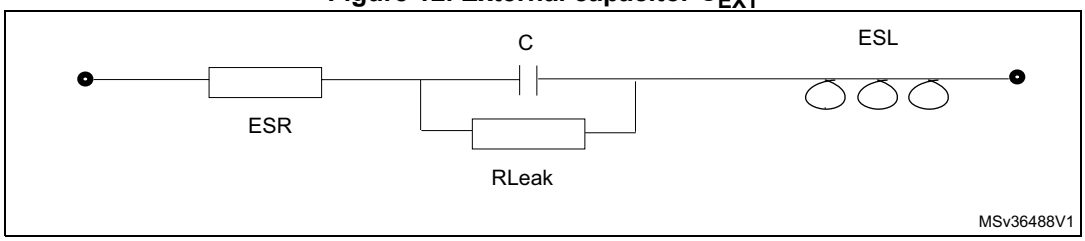
V_{IT-}	Brown-out reset threshold	-	2.58	2.73	2.88	
$V_{HYS(BOR)}$	Brown-out reset hysteresis	-	-	70(1)	-	mV

1. Guaranteed by design, not tested in production.
2. If V_{DD} is below 3 V, the code execution is guaranteed above the V_{IT-} and V_{IT+} thresholds. RAM content is kept. The EEPROM programming sequence must not be initiated.
3. There is inrush current into V_{DD} present after device power on to charge C_{EXT} capacitor. This inrush energy depends from C_{EXT} capacitor value. For example, a C_{EXT} of 1 µF requires Q=1 µF x 1.8 V = 1.8 µC.

10.3.1 VCAP external capacitor

Stabilization for the main regulator is achieved connecting an external capacitor C_{EXT} to the V_{CAP} pin. C_{EXT} is specified in *Table 24*. Care should be taken to limit the series inductance to less than 15 nH.

Figure 12. External capacitor C_{EXT}



1. Legend: ESR is the equivalent series resistance and ESL is the equivalent inductance.

10.3.2 Supply current characteristics

The current consumption is measured as described in *Figure 9 on page 59* and *Figure 10 on page 60*.

If not explicitly stated, general conditions of temperature and voltage apply.

1. During startup, the oscillator current consumption may reach 6 mA.
2. The supply current of the oscillator can be further optimized by selecting a high quality resonator with small R_m value. Refer to crystal manufacturer for more details

Absolute maximum ratings (electrical sensitivity)

Based on two different tests (ESD and LU) using specific measurement methods, the product is stressed to determine its performance in terms of electrical sensitivity. For more details, refer to the application note AN1181.

Electrostatic discharge (ESD)

Electrostatic discharges (3 positive then 3 negative pulses separated by 1 second) are applied to the pins of each sample according to each pin combination. The sample size depends on the number of supply pins in the device (3 parts*(n+1) supply pin). This test conforms to the JESD22-A114A/A115A standard. For more details, refer to the application note AN1181.

Table 47. ESD absolute maximum ratings

Symbol	Ratings	Conditions	Class	Maximum value(1)	Unit

$V_{ESD(MM)}$	Electrostatic discharge voltage (charge device model)	T_A = 25 °C, conforming to JESD22-A115	B	200

Static latch-up

Two complementary static tests are required on 10 parts to assess the latch-up performance.

- A supply overvoltage (applied to each power supply pin) and
- A current injection (applied to each input, output and configurable I/O pin) are performed on each sample.

This test conforms to the EIA/JESD 78 IC latch-up standard. For more details, refer to the application note AN1181.

Table 48. Electrical sensitivities

Symbol	Parameter	Conditions	Class(1)
LU	Static latch-up class	T_A = 25 °C	A
		T_A = 85 °C	
		T_A = 125 °C	
		T_A = 150 °C	

1. Class description: A Class is an STMicroelectronics internal specification. All its limits are higher than the JEDEC specifications, that means when a device belongs to class A it exceeds the JEDEC standard. B class strictly covers all the JEDEC criteria (international standard).
