

Welcome to E-XFL.COM

#### What is "Embedded - Microcontrollers"?

"Embedded - Microcontrollers" refer to small, integrated circuits designed to perform specific tasks within larger systems. These microcontrollers are essentially compact computers on a single chip, containing a processor core, memory, and programmable input/output peripherals. They are called "embedded" because they are embedded within electronic devices to control various functions, rather than serving as standalone computers. Microcontrollers are crucial in modern electronics, providing the intelligence and control needed for a wide range of applications.

#### Applications of "<u>Embedded -</u> <u>Microcontrollers</u>"

#### Details

E·XFl

Product Status	Active
Core Processor	HC08
Core Size	8-Bit
Speed	8MHz
Connectivity	-
Peripherals	LVD, POR, PWM
Number of I/O	13
Program Memory Size	1.5KB (1.5K × 8)
Program Memory Type	FLASH
EEPROM Size	-
RAM Size	128 x 8
Voltage - Supply (Vcc/Vdd)	2.7V ~ 5.5V
Data Converters	A/D 6x10b
Oscillator Type	Internal
Operating Temperature	-40°C ~ 125°C (TA)
Mounting Type	Surface Mount
Package / Case	16-SOIC (0.295", 7.50mm Width)
Supplier Device Package	16-SOIC
Purchase URL	https://www.e-xfl.com/pro/item?MUrl=&PartUrl=mc908qy2amdwer

Email: info@E-XFL.COM

Address: Room A, 16/F, Full Win Commercial Centre, 573 Nathan Road, Mongkok, Hong Kong

#### Analog-to-Digital Converter (ADC10) Module

charging. If externally available, connect the  $V_{\text{REFL}}$  pin to the same potential as  $V_{\text{SSA}}$  at the single point ground location.

### 3.7.5 ADC10 Channel Pins (ADn)

The ADC10 has multiple input channels. Empirical data shows that capacitors on the analog inputs improve performance in the presence of noise or when the source impedance is high. 0.01  $\mu$ F capacitors with good high-frequency characteristics are sufficient. These capacitors are not necessary in all cases, but when used they must be placed as close as possible to the package pins and be referenced to V<sub>SSA</sub>.

### 3.8 Registers

These registers control and monitor operation of the ADC10:

- ADC10 status and control register, ADSCR
- ADC10 data registers, ADRH and ADRL
- ADC10 clock register, ADCLK

### 3.8.1 ADC10 Status and Control Register

This section describes the function of the ADC10 status and control register (ADSCR). Writing ADSCR aborts the current conversion and initiates a new conversion (if the ADCH[4:0] bits are equal to a value other than all 1s).

	Bit 7	6	5	4	3	2	1	Bit 0
Read: Write:	COCO	AIEN	ADCO	ADCH4	ADCH3	ADCH2	ADCH1	ADCH0
Reset:	0	0	0	1	1	1	1	1

### Figure 3-3. ADC10 Status and Control Register (ADSCR)

### COCO — Conversion Complete Bit

COCO is a read-only bit which is set each time a conversion is completed. This bit is cleared whenever the status and control register is written or whenever the data register (low) is read.

- 1 = Conversion completed
- 0 = Conversion not completed

### AIEN — ADC10 Interrupt Enable Bit

When this bit is set, an interrupt is generated at the end of a conversion. The interrupt signal is cleared when the data register is read or the status/control register is written.

1 = ADC10 interrupt enabled

0 = ADC10 interrupt disabled

### ADCO — ADC10 Continuous Conversion Bit

When this bit is set, the ADC10 will begin to convert samples continuously (continuous conversion mode) and update the result registers at the end of each conversion, provided the ADCH[4:0] bits do not decode to all 1s. The ADC10 will continue to convert until the MCU enters reset, the MCU enters stop mode (if ACLKEN is clear), ADCLK is written, or until ADSCR is written again. If stop is entered (with ACLKEN low), continuous conversions will cease and can be restarted only with a write to ADSCR. Any write to ADSCR with ADCO set and the ADCH bits not all 1s will abort the current conversion and begin continuous conversions.

# Chapter 6 Computer Operating Properly (COP)

## 6.1 Introduction

The computer operating properly (COP) module contains a free-running counter that generates a reset if allowed to overflow. The COP module helps software recover from runaway code. Prevent a COP reset by clearing the COP counter periodically. The COP module can be disabled through the COPD bit in the configuration 1 (CONFIG1) register.

### SIM MODULE SIM RESET CIRCUIT BUSCLKX4 12-BIT SIM COUNTER RESET STATUS REGISTER **CLEAR STAGES 5-12 EARALL STAGES** COP TIMEOUT INTERNAL RESET SOURCES<sup>(1)</sup> STOP INSTRUCTION COPCTL WRITE COP CLOCK COP MODULE 6-BIT COP COUNTER COPEN (FROM SIM) COPD (FROM CONFIG1) CLEAR RESET COP COUNTER COPCTL WRITE COP RATE SELECT (COPRS FROM CONFIG1)

# 6.2 Functional Description

1. See Chapter 13 System Integration Module (SIM) for more details.

Figure 6-1. COP Block Diagram

### 7.3.3 Stack Pointer

The stack pointer is a 16-bit register that contains the address of the next location on the stack. During a reset, the stack pointer is preset to \$00FF. The reset stack pointer (RSP) instruction sets the least significant byte to \$FF and does not affect the most significant byte. The stack pointer decrements as data is pushed onto the stack and increments as data is pulled from the stack.

In the stack pointer 8-bit offset and 16-bit offset addressing modes, the stack pointer can function as an index register to access data on the stack. The CPU uses the contents of the stack pointer to determine the conditional address of the operand.

Figure 7-4. Stack Pointer (SP)

### NOTE

The location of the stack is arbitrary and may be relocated anywhere in random-access memory (RAM). Moving the SP out of page 0 (\$0000 to \$00FF) frees direct address (page 0) space. For correct operation, the stack pointer must point only to RAM locations.

### 7.3.4 Program Counter

The program counter is a 16-bit register that contains the address of the next instruction or operand to be fetched.

Normally, the program counter automatically increments to the next sequential memory location every time an instruction or operand is fetched. Jump, branch, and interrupt operations load the program counter with an address other than that of the next sequential location.

During reset, the program counter is loaded with the reset vector address located at \$FFFE and \$FFFF. The vector address is the address of the first instruction to be executed after exiting the reset state.

Figure 7-5. Program Counter (PC)

**Central Processor Unit (CPU)** 

## 7.7 Instruction Set Summary

Table 7-1 provides a summary of the M68HC08 instruction set.

### Table 7-1. Instruction Set Summary (Sheet 1 of 6)

External Interrupt (IRQ)

Oscillator (OSC) Module

## 11.8 Registers

The oscillator module contains two registers:

- Oscillator status and control register (OSCSC)
- Oscillator trim register (OSCTRIM)

### 11.8.1 Oscillator Status and Control Register

The oscillator status and control register (OSCSC) contains the bits for switching between internal and external clock sources. If the application uses an external crystal, bits in this register are used to select the crystal oscillator amplifier necessary for the desired crystal. While running off the internal clock source, the user can use bits in this register to select the internal clock source frequency.

### OSCOPT1:OSCOPT0 — OSC Option Bits

These read/write bits allow the user to change the clock source for the MCU. The default reset condition has the bus clock being derived from the internal oscillator. See 11.3.2.2 Internal to External Clock Switching for information on changing clock sources.

OSCOPT1	OSCOPT0	Oscillator Modes
0	0	Internal oscillator (frequency selected using ICFSx bits)
0	1	External oscillator clock
1	0	External RC
1	1	External crystal (range selected using ECFSx bits)

### ICFS1:ICFS0 — Internal Clock Frequency Select Bits

These read/write bits enable the frequency to be increased for applications requiring a faster bus clock when running off the internal oscillator. The WAIT instruction has no effect on the oscillator logic. BUSCLKX2 and BUSCLKX4 continue to drive to the SIM module.

ICFS1	ICFS0	Internal Clock Frequency
0	0	4.0 MHz
0	1	8.0 MHz
1	0	12.8 MHz — default reset condition
1	1	Reserved

# Chapter 12 Input/Output Ports (PORTS)

## 12.1 Introduction

The MC68HC08QY1A, MC68HC08QY2A and MC68HC08QY4A have thirteen bidirectional input-output (I/O) pins and one input only pin. The MC68HC08QT1A, MC68HC08QT2A and MC68HC08QT4A has five bidirectional I/O pins and one input only pin. All I/O pins are programmable as inputs or outputs.

## 12.2 Unused Pin Termination

Input pins and I/O port pins that are not used in the application must be terminated. This prevents excess current caused by floating inputs, and enhances immunity during noise or transient events. Termination methods include:

- 1. Configuring unused pins as outputs and driving high or low;
- 2. Configuring unused pins as inputs and enabling internal pull-ups;
- 3. Configuring unused pins as inputs and using external pull-up or pull-down resistors.

Never connect unused pins directly to V<sub>DD</sub> or V<sub>SS</sub>.

Since some general-purpose I/O pins are not available on all packages, these pins must be terminated as well. Either method 1 or 2 above are appropriate.

## 12.3 Port A

Port A is an 6-bit special function port that shares its pins with the keyboard interrupt (KBI) module (see Chapter 9 Keyboard Interrupt Module (KBI), the 2-channel timer interface module (TIM) (see Chapter 14 Timer Interface Module (TIM)), the 10-bit ADC (see Chapter 3 Analog-to-Digital Converter (ADC10) Module), the external interrupt (IRQ) pin (see Chapter 8 External Interrupt (IRQ)), the reset (RST) pin enabled using a configuration register (see Chapter 5 Configuration Register (CONFIG)) and the oscillator pins (see Chapter 11 Oscillator (OSC) Module).

Each port A pin also has a software configurable pullup device if the corresponding port pin is configured as an input port.

### NOTE

### PTA2 is input only.

When the IRQ function is enabled in the configuration register 2 (CONFIG2), bit 2 of the port A data register (PTA) will always read a logic 0. In this case, the BIH and BIL instructions can be used to read the logic level on the PTA2 pin. When the IRQ function is disabled, these instructions will behave as if the PTA2 pin is a logic 1. However, reading bit 2 of PTA will read the actual logic level on the pin.

### 12.4.2 Data Direction Register B

Data direction register B (DDRB) determines whether each port B pin is an input or an output. Writing a 1 to a DDRB bit enables the output buffer for the corresponding port B pin; a 0 disables the output buffer.

Figure 12-6. Data Direction Register B (DDRB)

### DDRB[7:0] — Data Direction Register B Bits

These read/write bits control port B data direction. Reset clears DDRB[7:0], configuring all port B pins as inputs.

1 = Corresponding port B pin configured as output

0 = Corresponding port B pin configured as input

NOTE

Avoid glitches on port B pins by writing to the port B data register before changing data direction register B bits from 0 to 1. Figure 12-7 shows the port B I/O logic.

### Figure 12-7. Port B I/O Circuit

When DDRBx is a 1, reading PTB reads the PTBx data latch. When DDRBx is a 0, reading PTB reads the logic level on the PTBx pin. The data latch can always be written, regardless of the state of its data direction bit.

System Integration Module (SIM)

Figure 13-7. Interrupt Processing

The value in the TIM channel registers determines the pulse width of the PWM output. The pulse width of an 8-bit PWM signal is variable in 256 increments. Writing \$0080 (128) to the TIM channel registers produces a duty cycle of 128/256 or 50%.

### 14.3.4.1 Unbuffered PWM Signal Generation

Any output compare channel can generate unbuffered PWM pulses as described in 14.3.4 Pulse Width Modulation (PWM). The pulses are unbuffered because changing the pulse width requires writing the new pulse width value over the old value currently in the TIM channel registers.

An unsynchronized write to the TIM channel registers to change a pulse width value could cause incorrect operation for up to two PWM periods. For example, writing a new value before the counter reaches the old value but after the counter reaches the new value prevents any compare during that PWM period. Also, using a TIM overflow interrupt routine to write a new, smaller pulse width value may cause the compare to be missed. The TIM may pass the new value before it is written to the timer channel (TCHxH:TCHxL).

Use the following methods to synchronize unbuffered changes in the PWM pulse width on channel x:

- When changing to a shorter pulse width, enable channel x output compare interrupts and write the new value in the output compare interrupt routine. The output compare interrupt occurs at the end of the current pulse. The interrupt routine has until the end of the PWM period to write the new value.
- When changing to a longer pulse width, enable TIM overflow interrupts and write the new value in the TIM overflow interrupt routine. The TIM overflow interrupt occurs at the end of the current PWM period. Writing a larger value in an output compare interrupt routine (at the end of the current pulse) could cause two output compares to occur in the same PWM period.

### NOTE

In PWM signal generation, do not program the PWM channel to toggle on output compare. Toggling on output compare prevents reliable 0% duty cycle generation and removes the ability of the channel to self-correct in the event of software error or noise. Toggling on output compare also can cause incorrect PWM signal generation when changing the PWM pulse width to a new, much larger value.

### 14.3.4.2 Buffered PWM Signal Generation

Channels 0 and 1 can be linked to form a buffered PWM channel whose output appears on the TCH0 pin. The TIM channel registers of the linked pair alternately control the output.

Setting the MS0B bit in TIM channel 0 status and control register (TSC0) links channel 0 and channel 1. The TIM channel 0 registers initially control the pulse width on the TCH0 pin. Writing to the TIM channel 1 registers enables the TIM channel 1 registers to synchronously control the pulse width at the beginning of the next PWM period. At each subsequent overflow, the TIM channel registers (0 or 1) that control the pulse width are the ones written to last. TSC0 controls and monitors the buffered PWM function, and TIM channel 1 status and control register (TSC1) is unused. While the MS0B bit is set, the channel 1 pin, TCH1, is available as a general-purpose I/O pin.

### NOTE

In buffered PWM signal generation, do not write new pulse width values to the currently active channel registers. User software should track the currently active channel to prevent writing a new value to the active

### 14.8.4 TIM Channel Status and Control Registers

Each of the TIM channel status and control registers does the following:

- · Flags input captures and output compares
- Enables input capture and output compare interrupts
- Selects input capture, output compare, or PWM operation
- Selects high, low, or toggling output on output compare
- Selects rising edge, falling edge, or any edge as the active input capture trigger
- Selects output toggling on TIM overflow
- Selects 0% and 100% PWM duty cycle
- · Selects buffered or unbuffered output compare/PWM operation

Figure 14-10. TIM Channel 1 Status and Control Register (TSC1)

### CHxF — Channel x Flag Bit

When channel x is an input capture channel, this read/write bit is set when an active edge occurs on the channel x pin. When channel x is an output compare channel, CHxF is set when the value in the counter registers matches the value in the TIM channel x registers.

Clear CHxF by reading the TSCx register with CHxF set and then writing a 0 to CHxF. If another interrupt request occurs before the clearing sequence is complete, then writing 0 to CHxF has no effect. Therefore, an interrupt request cannot be lost due to inadvertent clearing of CHxF.

Writing a 1 to CHxF has no effect.

- 1 = Input capture or output compare on channel x
- 0 = No input capture or output compare on channel x

### CHxIE — Channel x Interrupt Enable Bit

This read/write bit enables TIM interrupt service requests on channel x.

- 1 = Channel x interrupt requests enabled
- 0 = Channel x interrupt requests disabled

#### MSxB — Mode Select Bit B

This read/write bit selects buffered output compare/PWM operation. MSxB exists only in the TSC0.

### **Electrical Specifications**

Figure 16-9. Typical 5-Volt Run Current versus Bus Frequency (25•C)

Figure 16-10. Typical 3-Volt Run Current versus Bus Frequency (25•C)

## **16.14 Timer Interface Module Characteristics**

Characteristic	Symbol	Min	Max	Unit
Timer input capture pulse width <sup>(1)</sup>	t <sub>TH,</sub> t <sub>TL</sub>	2	—	t <sub>cyc</sub>
Timer input capture period	t <sub>TLTL</sub>	Note <sup>(2)</sup>	—	t <sub>cyc</sub>
Timer input clock pulse width <sup>(1)</sup>	t <sub>TCL</sub> , t <sub>TCH</sub>	t <sub>cyc</sub> + 5	—	ns

1. Values are based on characterization results, not tested in production.

2. The minimum period is the number of cycles it takes to execute the interrupt service routine plus 1  $t_{cyc}$ .

Figure 16-11. Timer Input Timing

**Electrical Specifications** 

## **16.15 Memory Characteristics**

Characteristic	Symbol	Min	Тур	Max	Unit
RAM data retention voltage <sup>(1)</sup>	V <sub>RDR</sub>	1.3	-	_	V
FLASH program bus clock frequency	_	1			MHz
FLASH PGM/ERASE supply voltage (V <sub>DD</sub> )	V <sub>PGM/ERASE</sub>	2.7		5.5	V
FLASH read bus clock frequency	f <sub>Read</sub> <sup>(2)</sup>	0	_	8 M	Hz
FLASH page erase time <1 K cycles >1 K cycles	t <sub>Erase</sub>	0.9 3.6	1 4	1.1 5.5	ms
FLASH mass erase time	t <sub>MErase</sub>	4			ms
FLASH PGM/ERASE to HVEN setup time	t <sub>NVS</sub>	10		_	μs
FLASH high-voltage hold time	t <sub>NVH</sub>	5		_	μs
FLASH high-voltage hold time (mass erase)	t <sub>NVHL</sub>	100		_	μs
FLASH program hold time	t <sub>PGS</sub>	5		_	μs
FLASH program time	t <sub>PROG</sub>	30	_	40	μs
FLASH return to read time	t <sub>RCV</sub> <sup>(3)</sup>	1	_	_	μs
FLASH cumulative program hv period	t <sub>HV</sub> <sup>(4)</sup>	—	_	4	ms
FLASH endurance <sup>(5)</sup>		10 k	100 k		Cycles
FLASH data retention time <sup>(6)</sup>	_	15	100	_	Years

1. Values are based on characterization results, not tested in production.

2. f<sub>Read</sub> is defined as the frequency range for which the FLASH memory can be read.

3. t<sub>RCV</sub> is defined as the time it needs before the FLASH can be read after turning off the high voltage charge pump, by clearing HVEN to 0.

4. t<sub>HV</sub> is defined as the cumulative high voltage programming time to the same row before next erase.

t<sub>HV</sub> must satisfy this condition: t<sub>NVS</sub> + t<sub>NVH</sub> + t<sub>PGS</sub> + (t<sub>PROG</sub> x 32) ≤ t<sub>HV</sub> maximum.
Typical endurance was evaluated for this product family. For additional information on how Freescale Semiconductor defines *Typical Endurance*, please refer to Engineering Bulletin EB619.

6. Typical data retention values are based on intrinsic capability of the technology measured at high temperature and de-rated to 25•C using the Arrhenius equation. For additional information on how Freescale Semiconductor defines Typical Data Retention, please refer to Engineering Bulletin EB618.

Information in this document is provided solely to enable system and software implementers to use Freescale Semiconductor products. There are no express or implied copyright licenses granted hereunder to design or fabricate any integrated circuits or integrated circuits based on the information in this document.

Freescale Semiconductor reserves the right to make changes without further notice to any products herein. Freescale Semiconductor makes no warranty, representation or guarantee regarding the suitability of its products for any particular purpose, nor does Freescale Semiconductor assume any liability arising out of the application or use of any product or circuit, and specifically disclaims any and all liability, including without limitation consequential or incidental damages. "Typical" parameters that may be provided in Freescale Semiconductor data sheets and/or specifications can and do vary in different applications and actual performance may vary over time. All operating parameters, including "Typicals", must be validated for each customer application by customer's technical experts. Freescale Semiconductor does not convey any license under its patent rights nor the rights of others. Freescale Semiconductor products are not designed, intended, or authorized for use as components in systems intended for surgical implant into the body, or other applications intended to support or sustain life, or for any other application in which the failure of the Freescale Semiconductor product could create a situation where personal injury or death may occur. Should Buyer purchase or use Freescale Semiconductor products for any such unintended or unauthorized application, Buyer shall indemnify and hold Freescale Semiconductor and its officers, employees, subsidiaries, affiliates, and distributors harmless against all claims, costs, damages, and expenses, and reasonable attorney fees arising out of, directly or indirectly, any claim of personal injury or death associated with such unintended or unauthorized use, even if such claim alleges that Freescale Semiconductor was negligent regarding the design or manufacture of the part.
