
Welcome to E-XFL.COM

What is "Embedded - Microcontrollers"?

"Embedded - Microcontrollers" refer to small, integrated circuits designed to perform specific tasks within larger systems. These microcontrollers are essentially compact computers on a single chip, containing a processor core, memory, and programmable input/output peripherals. They are called "embedded" because they are embedded within electronic devices to control various functions, rather than serving as standalone computers. Microcontrollers are crucial in modern electronics, providing the intelligence and control needed for a wide range of applications.

Applications of "Embedded - Microcontrollers"

Details	
Product Status	Obsolete
Core Processor	Z8
Core Size	8-Bit
Speed	33MHz
Connectivity	EBI/EMI, UART/USART
Peripherals	-
Number of I/O	24
Program Memory Size	-
Program Memory Type	ROMless
EEPROM Size	-
RAM Size	236 x 8
Voltage - Supply (Vcc/Vdd)	4.5V ~ 5.5V
Data Converters	-
Oscillator Type	Internal
Operating Temperature	0°C ~ 70°C (TA)
Mounting Type	Surface Mount
Package / Case	44-LQFP
Supplier Device Package	44-LQFP (10x10)
Purchase URL	https://www.e-xfl.com/product-detail/zilog/z86c9333fsc

ZiLOG

PRODUCT SPECIFICATION

Z86C93

CMOS Z8® MULTIPLY/DIVIDE MICROCONTROLLER

FEATURES

- Complete microcontroller, up to 24 I/O lines, and up to 64 Kbytes of addressable external space each for program and data memory.
- 16-bit x 16-bit hardwired multiplier with 32-bit product in 17 clock cycles.
- 32-bit x 16-bit hardwired divider with 16-bit quotient and 16-bit remainder in 20 clock cycles.
- 256-byte register file, including 236 general-purpose registers, up to three I/O port registers and 16 status and control registers.
- 17-byte Expanded Register File, including two general-purpose registers and 15 status and control registers.
- Vectored, priority interrupts for I/O, counter/timers and UART.
- On-chip oscillator that accepts crystal or external clock drive.
- Two 16-bit counter timers with 6-bit prescalers.
- Third 16-bit counter/timer with 4-bit prescaler, one capture register and a fast decrement mode.
- Register Pointer for short, fast instructions that can access any one of the sixteen working register groups.
- Additional emulation signals SCLK, IACK, and /SYNC are made available.
- Two low power standby modes, STOP and HALT
- Full-duplex UART
- 3.3 ± 10% volt operation at 25 MHz
- 5.0 ± 10% volt operation at 20, 25 and 33 MHz

GENERAL DESCRIPTION

The Z86C93 is a CMOS ROMless Z8 microcontroller enhanced with a hardwired 16-bit x 16-bit multiplier and 32-bit/16-bit divider and three 16-bit counter timers (Figure 1). A capture register and a fast decrement mode is also provided. It is offered in 40-pin PDIP, 44-pin PLCC, 44-pin QFP and 48-pin VQFP (Figures 2, 3, 4, 5 and 6). Besides the four additional signals (SCLK, IACK, /SYNC and /WAIT), the Z86C93 is compatible with the Z86C91, yet it offers a much more powerful mathematical capability.

The Z86C93 provides up to 16 output address lines permitting an address space of up to 64 Kbytes of data and program memory each. Eight address outputs (AD7-AD0) are provided by a multiplexed, 8-bit, Address/Data bus. The remaining 8 bits can be provided by the software configuration of Port 0 to output address bits A15-A8.

48	SCLK	System Clock	Output

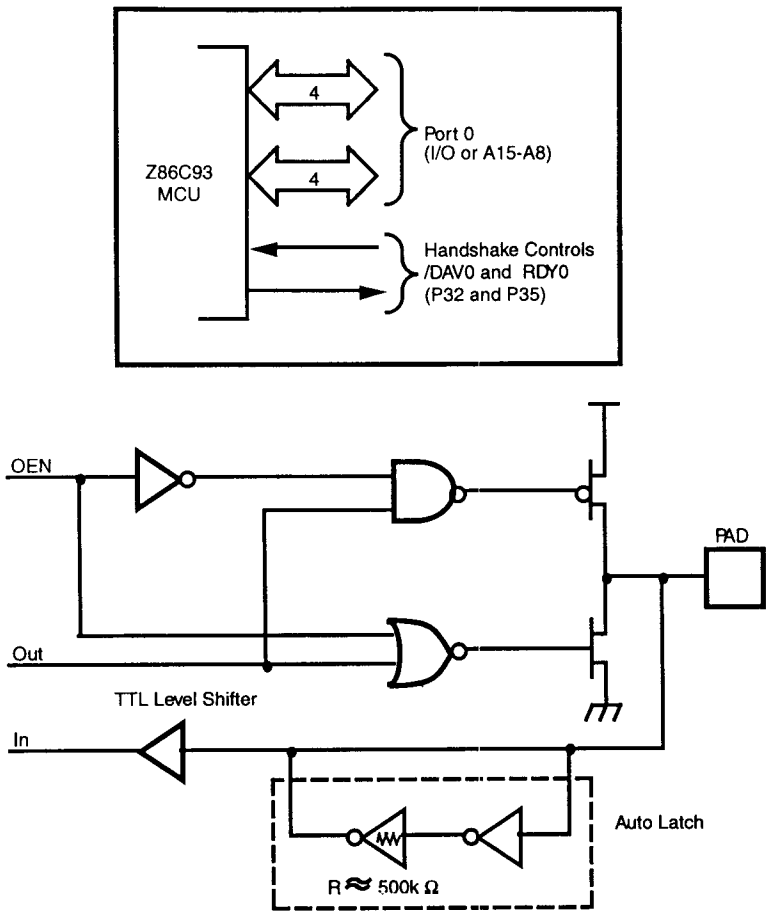

Figure 7. Port 0 Configuration

PIN FUNCTIONS (Continued)

Port 1. (P10-P17). Port 1 is an 8-bit, TTL compatible port. It has multiplexed Address (A7-A0) and Data (D7-D0) ports for interfacing external memory (Figure 8).

If more than 256 external locations are required, Port 0 must output the additional lines.

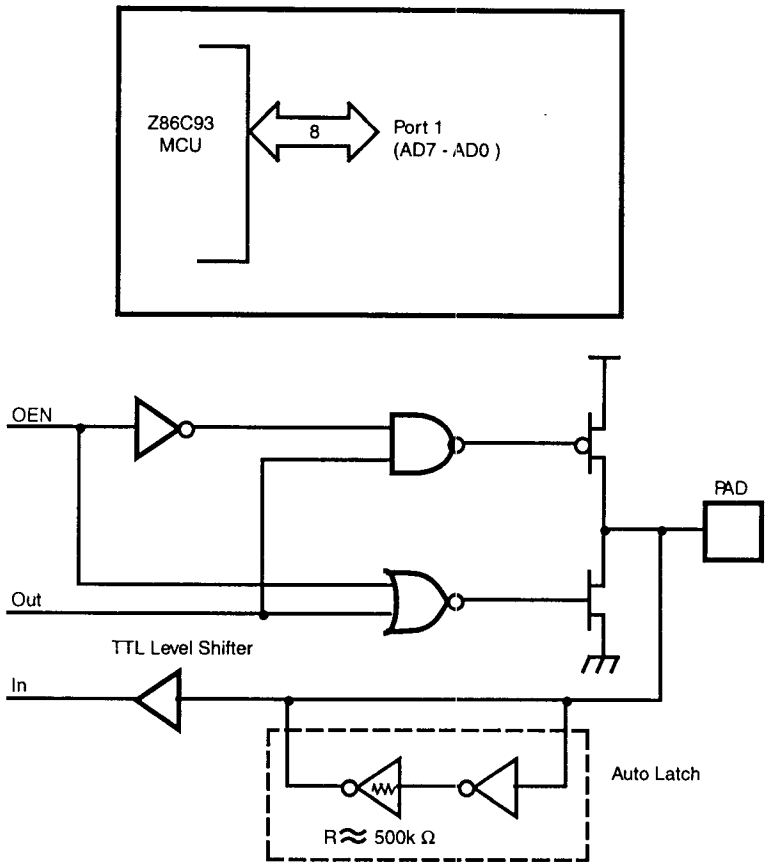

Figure 8. Port 1 Configuration

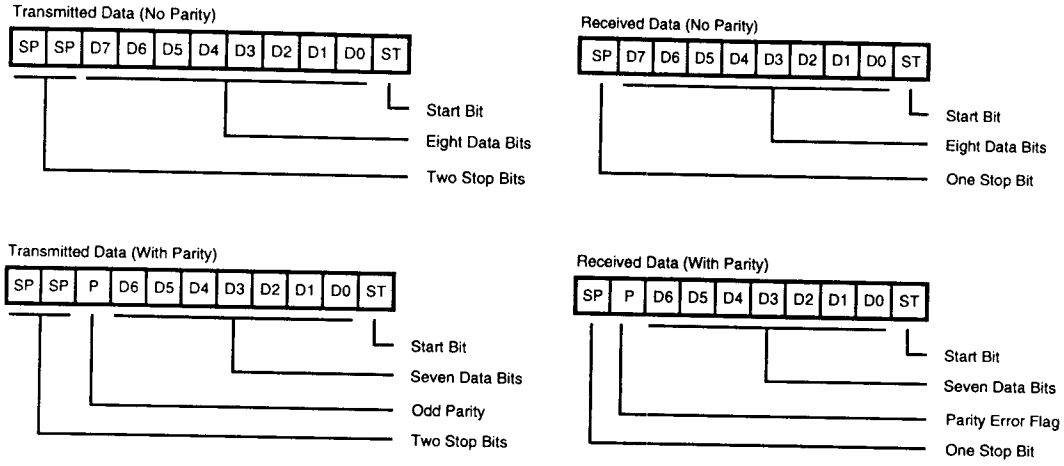

Figure 11. Serial Data Formats

ADDRESS SPACE

Program Memory. The Z86C93 can address up to 64 Kbytes of external program memory. Program execution begins at external location 000CH after a reset.

Data Memory. The Z96C93 can address up to 64 Kbytes of external data memory. External data memory is included with, or separated from, the external program memory space. /DM, an optional I/O function that can be programmed to appear on pin P34 is used to distinguish between data and program memory space (Figure 12). The state of the /DM signal is controlled by the type instruction being executed. An LDC opcode references PROGRAM (/DM inactive) memory, and an LDE instruction references DATA (/DM active Low) memory.

FUNCTIONAL DESCRIPTION

This section breaks down the Z86C93 into its main functional parts.

Multiply/Divide Unit

The Multiply/Divide unit describes the basic features, implementation details of the interface between the Z8 and the multiply/divide unit.

Basic features:

- 16-bit by 16-bit multiply with 32-bit product
- 32-bit by 16-bit divide with 16-bit quotient and 16-bit remainder
- Unsigned integer data format
- Simple interface to Z8

Interface to Z8. The following is a brief description of the register mapping in the multiply/divide unit and its interface to the Z8 (Figure 16).

The multiply/divide unit is interfaced like a peripheral. The only addressing mode available with the peripheral interface is register addressing. In other words, all of the operands are in the respective registers before a multiplication/division can start.

Register mapping. The registers used in the multiply/divide unit are mapped onto the expanded register file in Bank E. The exact register locations used are shown below.

REGISTER	ADDRESS
MREG0	(E) 00
MREG1	(E) 01
MREG2	(E) 02
MREG3	(E) 03
MREG4	(E) 04
MREG5	(E) 05
MDCON	(E) 06
GPR	(E) 14
GPR	(E) 15

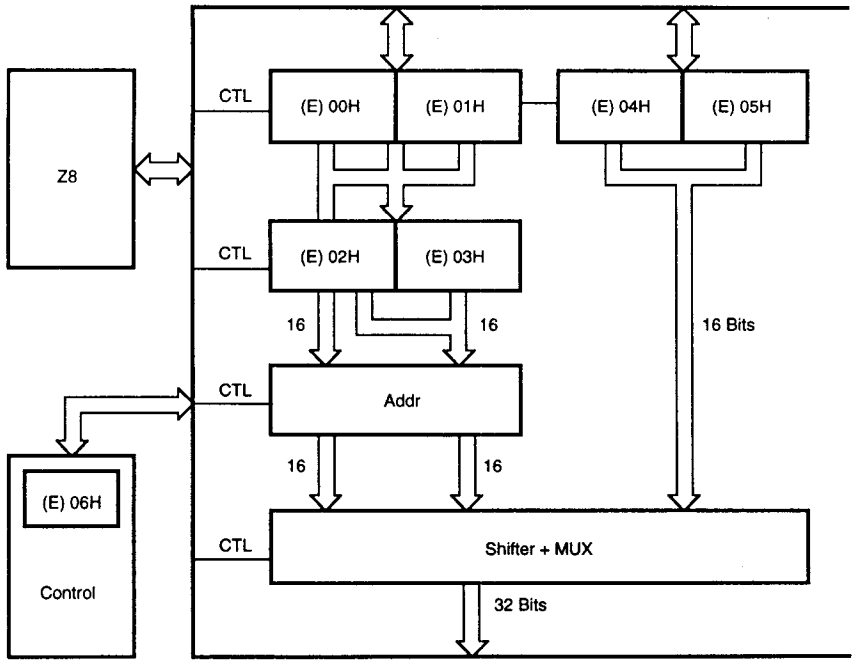

Figure 16. Multiply/Divide Unit Block Diagram

Table 7. Interrupt Types, Sources, and Vectors

Name	Source	Vector Location	Comments
IRQ 0	/DAV 0, P32, T2	0, 1	External (P32), Programmable Rise or Fall Edge Triggered
IRQ 1,	P33	2, 3	External (P33), Fall Edge Triggered
IRQ 2	/DAV 2, P31, T_{IN}	4, 5	External (P31), Programmable Rise or Fall Edge Triggered
IRQ 3	P30, Serial In	6, 7	External (P30), Fall Edge Triggered
IRQ 4	T0, Serial Out	8, 9	Internal
IRQ 5	TI	10, 11	Internal

Clock

The Z86C93 on-chip oscillator has a high-gain, parallel-resonant amplifier for connection to a crystal, LC, ceramic resonator, or any suitable external clock source (XTAL1=Input, XTAL2=Output). The external clock levels are not TTL. The crystal should be AT cut, 1 MHz to 25 MHz max, and series resistance (RS) is less than or equal to 100 Ohms. The crystal should be connected across XTAL1 and XTAL2 using the recommended capacitors (10 pF<CL<100 pF) from each pin to ground (Figure 20).

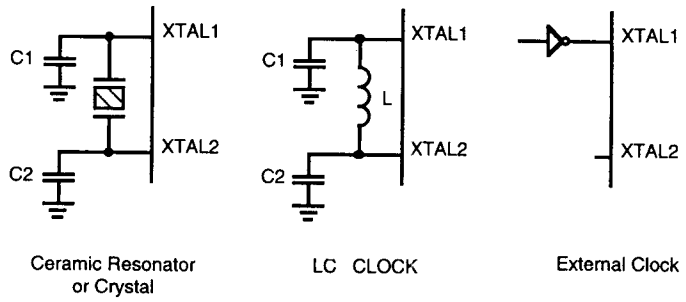

Figure 22. Oscillator Configuration

Power Down Modes

HALT. Turns off the internal CPU clock but not the XTAL oscillation. The counter/timers and the external interrupts IRQ0, IRQ1, IRQ2 and IRQ3 remain active. The devices are recovered by interrupts, either externally or internally generated. During HALT mode, /DS, /AS and R/W are HIGH. The outputs retain their preview value, and the inputs are floating.

STOP. This instruction turns off the internal clock and external crystal oscillation and reduces the standby current to 10 µA or less. The STOP mode is terminated by a /RESET, which causes the processor to restart the application program at address 000CH.

In order to enter STOP (or HALT) mode, it is necessary to first flush the instruction pipeline to avoid suspending execution in mid-instruction. To do this, the user executes a NOP (opcode=OFFH) immediately before the appropriate sleep instruction, i.e.:

```
FF  NOP   ; clear the pipeline
6F  STOP  ; enter STOP mode
          or
FF  NOP   ; clear the pipeline
7F  HALT  ; enter HALT mode
```

ABSOLUTE MAXIMUM RATINGS

Symbol	Description	Min	Max	Units
V_{CC}	Supply Voltage*	-0.3	+7.0	V
T_{STG}	Storage Temp	-65	+150	C
T_A	Oper Ambient Temp	†	†	C

* Voltages on all pins with respect to GND.
† See Ordering Information

Stress greater than those listed under Absolute Maximum Ratings may cause permanent damage to the device. This is a stress rating only; operation of the device at any condition above those indicated in the operational sections of these specifications is not implied. Exposure to absolute maximum rating conditions for an extended period may affect device reliability.

STANDARD TEST CONDITIONS

The characteristics listed below apply for standard test conditions as noted. All voltages are referenced to GND. Positive current flows into the referenced pin Test Load Diagram (Figure 23).

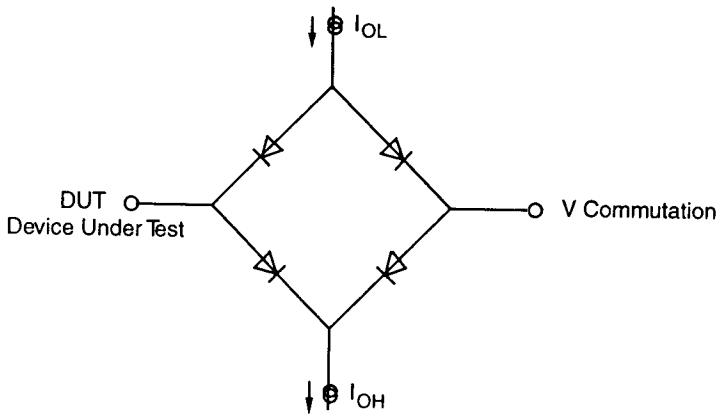

Figure 23. Test Load Diagram

DC ELECTRICAL CHARACTERISTICS

V_{CC} = 3.3V ± 10%

Sym	Parameter	T_A = 0°C to +70°C Min	Max	Typical at 25°C	Units	Conditions

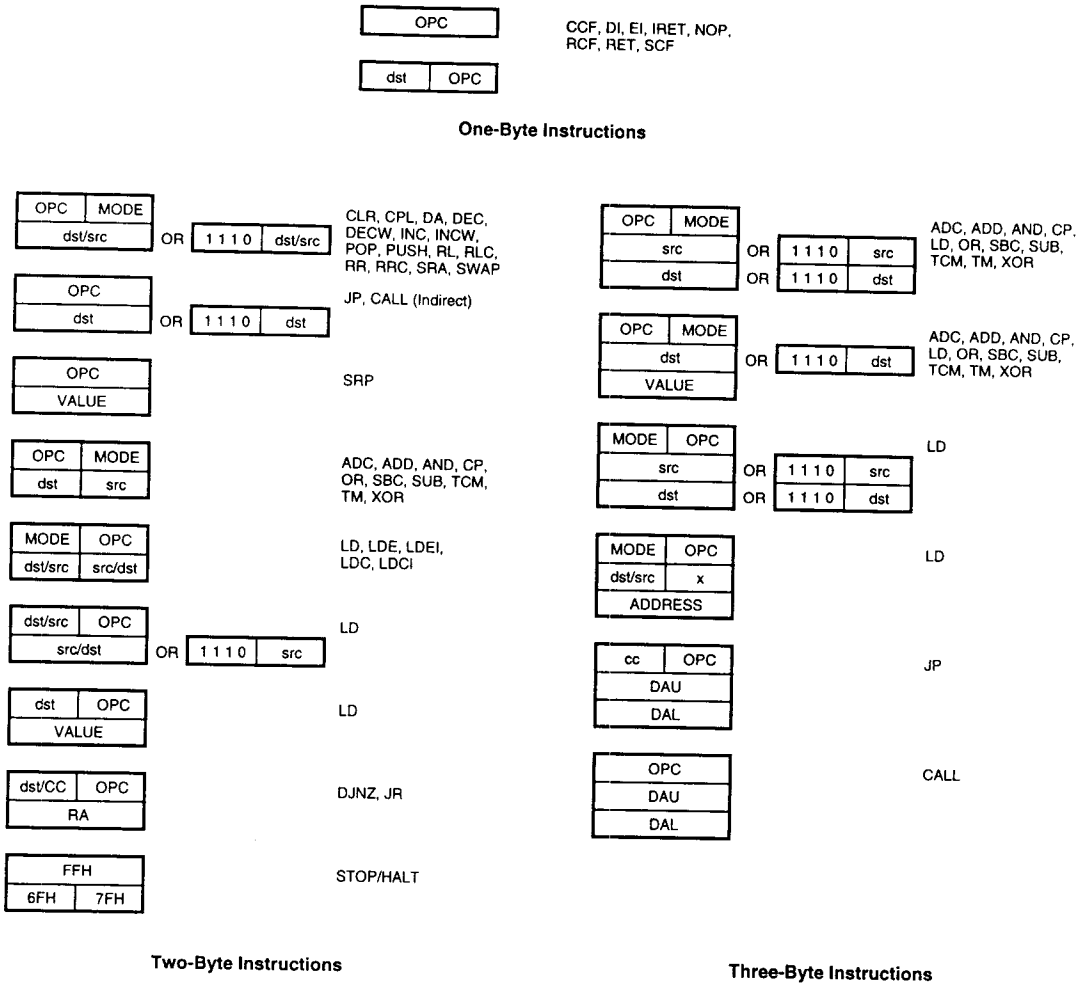
INSTRUCTION FORMATS



INSTRUCTION SUMMARY

Note: Assignment of a value is indicated by the symbol " ← ". For example:

dst ← dst + src

indicates that the source data is added to the destination data and the result is stored in the destination location. The notation "addr (n)" is used to refer to bit (n) of a given operand location. For example:

dst (7)

refers to bit 7 of the destination operand.

INSTRUCTION SUMMARY (Continued)

Instruction and Operation	Address Mode dst	Address Mode src	Opcode Byte (Hex)	Flags Affected C	Z	S	V	D	H

XOR dst, src dst←dst XOR src	†		B[ ]	-	*	*	0	-	-

† These instructions have an identical set of addressing modes, which are encoded for brevity. The first opcode nibble is found in the instruction set table above. The second nibble is expressed symbolically by a '[ ]' in this table, and its value is found in the following table to the left of the applicable addressing mode pair.

For example, the opcode of an ADC instruction using the addressing modes r (destination) and Ir (source) is 13.

Address Mode dst	Address Mode src	Lower Opcode Nibble
r	r	[2]
r	Ir	[3]
R	R	[4]
R	IR	[5]
R	IM	[6]
IR	IM	[7]
