

Welcome to [E-XFL.COM](#)

What is "[Embedded - Microcontrollers](#)"?

"[Embedded - Microcontrollers](#)" refer to small, integrated circuits designed to perform specific tasks within larger systems. These microcontrollers are essentially compact computers on a single chip, containing a processor core, memory, and programmable input/output peripherals. They are called "embedded" because they are embedded within electronic devices to control various functions, rather than serving as standalone computers. Microcontrollers are crucial in modern electronics, providing the intelligence and control needed for a wide range of applications.

Applications of "[Embedded - Microcontrollers](#)"

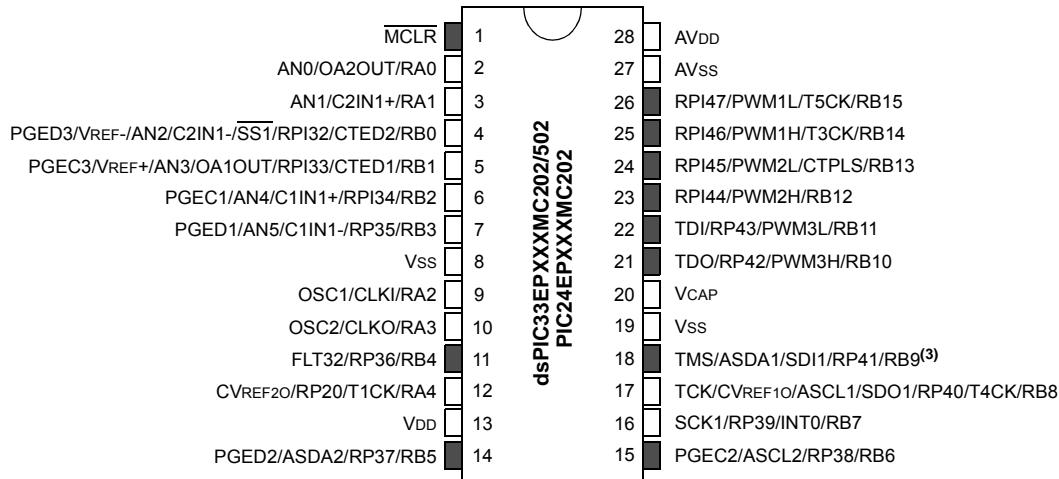

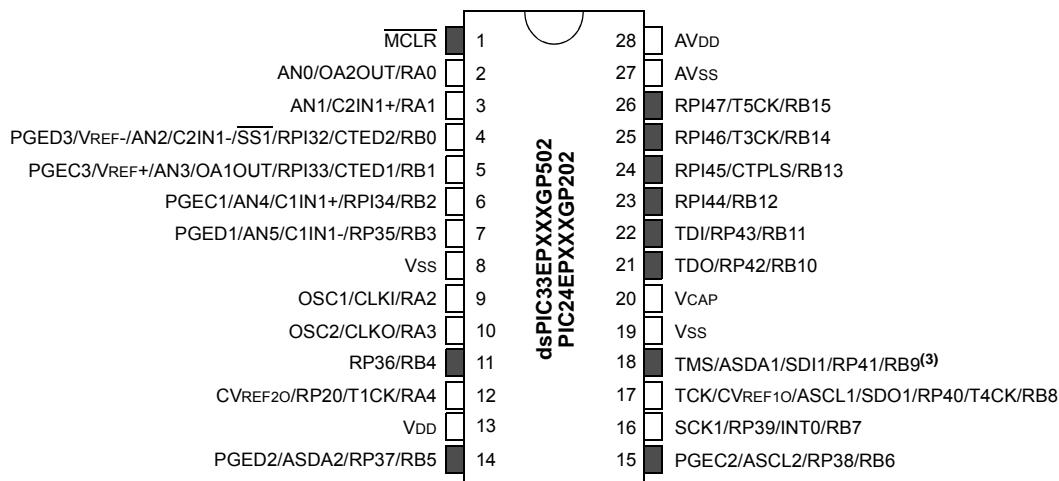

Details

Product Status	Active
Core Processor	dsPIC
Core Size	16-Bit
Speed	70 MIPS
Connectivity	CANbus, I ² C, IrDA, LINbus, QEI, SPI, UART/USART
Peripherals	Brown-out Detect/Reset, DMA, Motor Control PWM, POR, PWM, WDT
Number of I/O	35
Program Memory Size	256KB (85.5K x 24)
Program Memory Type	FLASH
EEPROM Size	-
RAM Size	16K x 16
Voltage - Supply (Vcc/Vdd)	3V ~ 3.6V
Data Converters	A/D 9x10b/12b
Oscillator Type	Internal
Operating Temperature	-40°C ~ 85°C (TA)
Mounting Type	Surface Mount
Package / Case	44-TQFP
Supplier Device Package	44-TQFP (10x10)
Purchase URL	https://www.e-xfl.com/product-detail/microchip-technology/dspic33ep256mc504t-i-pt

Pin Diagrams

28-Pin SPDIP/SOIC/SSOP^(1,2)

■ = Pins are up to 5V tolerant

- Note 1:** The RPn/RPI_n pins can be used by any remappable peripheral with some limitation. See **Section 11.4 "Peripheral Pin Select (PPS)"** for available peripherals and for information on limitations.
- 2:** Every I/O port pin (RA_x-RG_x) can be used as a Change Notification pin (CNA_x-CNG_x). See **Section 11.0 "I/O Ports"** for more information.
- 3:** There is an internal pull-up resistor connected to the TMS pin when the JTAG interface is active. See the JTGEN bit field in Table 27-2.

Legend: — = unimplemented, read as '0'. Reset values are shown in hexadecimal.

11.1.1 OPEN-DRAIN CONFIGURATION

In addition to the PORT_x, LAT_x and TRIS_x registers for data control, port pins can also be individually configured for either digital or open-drain output. This is controlled by the Open-Drain Control register, ODC_x, associated with each port. Setting any of the bits configures the corresponding pin to act as an open-drain output.

The open-drain feature allows the generation of outputs other than V_{DD} by using external pull-up resistors. The maximum open-drain voltage allowed on any pin is the same as the maximum V_{IH} specification for that particular pin.

See the “**Pin Diagrams**” section for the available 5V tolerant pins and Table 30-11 for the maximum V_{IH} specification for each pin.

11.2 Configuring Analog and Digital Port Pins

The ANSEL_x register controls the operation of the analog port pins. The port pins that are to function as analog inputs or outputs must have their corresponding ANSEL_x and TRIS_x bits set. In order to use port pins for I/O functionality with digital modules, such as Timers, UARTs, etc., the corresponding ANSEL_x bit must be cleared.

The ANSEL_x register has a default value of 0xFFFF; therefore, all pins that share analog functions are analog (not digital) by default.

Pins with analog functions affected by the ANSEL_x registers are listed with a buffer type of analog in the Pinout I/O Descriptions (see Table 1-1).

If the TRIS_x bit is cleared (output) while the ANSEL_x bit is set, the digital output level (V_{OH} or V_{OL}) is converted by an analog peripheral, such as the ADC module or comparator module.

When the PORT_x register is read, all pins configured as analog input channels are read as cleared (a low level).

Pins configured as digital inputs do not convert an analog input. Analog levels on any pin defined as a digital input (including the AN_x pins) can cause the input buffer to consume current that exceeds the device specifications.

11.2.1 I/O PORT WRITE/READ TIMING

One instruction cycle is required between a port direction change or port write operation and a read operation of the same port. Typically this instruction would be a NOP, as shown in Example 11-1.

11.3 Input Change Notification (ICN)

The Input Change Notification function of the I/O ports allows devices to generate interrupt requests to the processor in response to a Change-of-State (COS) on selected input pins. This feature can detect input Change-of-States even in Sleep mode, when the clocks are disabled. Every I/O port pin can be selected (enabled) for generating an interrupt request on a Change-of-State.

Three control registers are associated with the Change Notification (CN) functionality of each I/O port. The CNEN_x registers contain the CN interrupt enable control bits for each of the input pins. Setting any of these bits enables a CN interrupt for the corresponding pins.

Each I/O pin also has a weak pull-up and a weak pull-down connected to it. The pull-ups and pull-downs act as a current source or sink source connected to the pin and eliminate the need for external resistors when push button, or keypad devices are connected. The pull-ups and pull-downs are enabled separately, using the CNP_{UX} and the CNP_{Dx} registers, which contain the control bits for each of the pins. Setting any of the control bits enables the weak pull-ups and/or pull-downs for the corresponding pins.

Note: Pull-ups and pull-downs on Change Notification pins should always be disabled when the port pin is configured as a digital output.

EXAMPLE 11-1: PORT WRITE/READ EXAMPLE

```
MOV 0xFF00, W0 ; Configure PORTB<15:8>
                  ; as inputs
MOV W0, TRISB ; and PORTB<7:0>
                  ; as outputs
NOP           ; Delay 1 cycle
BTSS  PORTB, #13 ; Next Instruction
```

bit 15-8 **STEP(2x + 1)<7:0>:** PTG Step Queue Pointer Register bits⁽²⁾

A queue location for storage of the STEP(2x + 1) command byte.

bit 7-0 **STEP(2x)<7:0>:** PTG Step Queue Pointer Register bits⁽²⁾

A queue location for storage of the STEP(2x) command byte.

Note 1: This register is read-only when the PTG module is executing Step commands (PTGEN = 1 and PTGSTART = 1).

2: Refer to Table 24-1 for the Step command encoding.

3: The Step registers maintain their values on any type of Reset.

24.4 Step Commands and Format

TABLE 24-1: PTG STEP COMMAND FORMAT

Step Command Byte:		
STEPx<7:0>		
CMD<3:0>	OPTION<3:0>	
bit 7	bit 4 bit 3	bit 0

bit 7-4	CMD<3:0>	Step Command	Command Description
	0000	PTGCTRL	Execute control command as described by OPTION<3:0>.
	0001	PTGADD	Add contents of PTGADJ register to target register as described by OPTION<3:0>.
		PTGCOPY	Copy contents of PTGHOLD register to target register as described by OPTION<3:0>.
	001x	PTGSTRB	Copy the value contained in CMD<0>:OPTION<3:0> to the CH0SA<4:0> bits (AD1CHS0<4:0>).
	0100	PTGWHI	Wait for a low-to-high edge input from the selected PTG trigger input as described by OPTION<3:0>.
	0101	PTGWLO	Wait for a high-to-low edge input from the selected PTG trigger input as described by OPTION<3:0>.
	0110	Reserved	Reserved.
	0111	PTGIRQ	Generate individual interrupt request as described by OPTION3<:0>.
	100x	PTGTRIG	Generate individual trigger output as described by <<CMD<0>:OPTION<3:0>>.
	101x	PTGJMP	Copy the value indicated in <<CMD<0>:OPTION<3:0>> to the Queue Pointer (PTGQPTR) and jump to that Step queue.
	110x	PTGJMPC0	PTGC0 = PTGC0LIM: Increment the Queue Pointer (PTGQPTR). PTGC0 ≠ PTGC0LIM: Increment Counter 0 (PTGC0) and copy the value indicated in <<CMD<0>:OPTION<3:0>> to the Queue Pointer (PTGQPTR), and jump to that Step queue
	111x	PTGJMPC1	PTGC1 = PTGC1LIM: Increment the Queue Pointer (PTGQPTR). PTGC1 ≠ PTGC1LIM: Increment Counter 1 (PTGC1) and copy the value indicated in <<CMD<0>:OPTION<3:0>> to the Queue Pointer (PTGQPTR), and jump to that Step queue.

Note 1: All reserved commands or options will execute but have no effect (i.e., execute as a NOP instruction).

2: Refer to Table 24-2 for the trigger output descriptions.

3: This feature is only available on dsPIC33EPXXXMC20X/50X and PIC24EPXXXMC20X devices.

TABLE 28-2: INSTRUCTION SET OVERVIEW (CONTINUED)

Base Instr #	Assembly Mnemonic	Assembly Syntax	Description	# of Words	# of Cycles ⁽²⁾	Status Flags Affected
46	MOV	MOV f ,Wn	Move f to Wn	1	1	None
		MOV f	Move f to f	1	1	None
		MOV f ,WREG	Move f to WREG	1	1	None
		MOV #lit16,Wn	Move 16-bit literal to Wn	1	1	None
		MOV.b #lit8,Wn	Move 8-bit literal to Wn	1	1	None
		MOV Wn,f	Move Wn to f	1	1	None
		MOV Ws0,Wd0	Move Ws to Wd	1	1	None
		MOV WREG,f	Move WREG to f	1	1	None
		MOV.D Wns,Wd	Move Double from W(ns):W(ns + 1) to Wd	1	2	None
		MOV.D Ws,Wnd	Move Double from Ws to W(nd + 1):W(nd)	1	2	None
47	MOVPG	MOVPG #lit10,DSRPAG	Move 10-bit literal to DSRPAG	1	1	None
		MOVPG #lit9,DSWPAG	Move 9-bit literal to DSWPAG	1	1	None
		MOVPG #lit8,TBLPAG	Move 8-bit literal to TBLPAG	1	1	None
		MOVPG Ws, DSRPAG	Move Ws<9:0> to DSRPAG	1	1	None
		MOVPG Ws, DSWPAG	Move Ws<8:0> to DSWPAG	1	1	None
		MOVPG Ws, TBLPAG	Move Ws<7:0> to TBLPAG	1	1	None
48	MOVSAC	MOVSAC Acc,Wx,Wxd,Wy,Wyd,AWB ⁽¹⁾	Prefetch and store accumulator	1	1	None
49	MPY	MPY Wm*Wn,Acc,Wx,Wxd,Wy,Wyd ⁽¹⁾	Multiply Wm by Wn to Accumulator	1	1	OA,OB,OAB, SA,SB,SAB
		MPY Wm*Wm,Acc,Wx,Wxd,Wy,Wyd ⁽¹⁾	Square Wm to Accumulator	1	1	OA,OB,OAB, SA,SB,SAB
50	MPY.N	MPY.N Wm*Wn,Acc,Wx,Wxd,Wy,Wyd ⁽¹⁾	-(Multiply Wm by Wn) to Accumulator	1	1	None
51	MSC	MSC Wm*Wm,Acc,Wx,Wxd,Wy,Wyd,AWB ⁽¹⁾	Multiply and Subtract from Accumulator	1	1	OA,OB,OAB, SA,SB,SAB

Note 1: These instructions are available in dsPIC33EPXXXMC20X/50X and PIC24EPXXXMC20X devices only.

2: Read and Read-Modify-Write (e.g., bit operations and logical operations) on non-CPU SFRs incur an additional instruction cycle.

29.6 MPLAB X SIM Software Simulator

The MPLAB X SIM Software Simulator allows code development in a PC-hosted environment by simulating the PIC MCUs and dsPIC DSCs on an instruction level. On any given instruction, the data areas can be examined or modified and stimuli can be applied from a comprehensive stimulus controller. Registers can be logged to files for further run-time analysis. The trace buffer and logic analyzer display extend the power of the simulator to record and track program execution, actions on I/O, most peripherals and internal registers.

The MPLAB X SIM Software Simulator fully supports symbolic debugging using the MPLAB XC Compilers, and the MPASM and MPLAB Assemblers. The software simulator offers the flexibility to develop and debug code outside of the hardware laboratory environment, making it an excellent, economical software development tool.

29.7 MPLAB REAL ICE In-Circuit Emulator System

The MPLAB REAL ICE In-Circuit Emulator System is Microchip's next generation high-speed emulator for Microchip Flash DSC and MCU devices. It debugs and programs all 8, 16 and 32-bit MCU, and DSC devices with the easy-to-use, powerful graphical user interface of the MPLAB X IDE.

The emulator is connected to the design engineer's PC using a high-speed USB 2.0 interface and is connected to the target with either a connector compatible with in-circuit debugger systems (RJ-11) or with the new high-speed, noise tolerant, Low-Voltage Differential Signal (LVDS) interconnection (CAT5).

The emulator is field upgradable through future firmware downloads in MPLAB X IDE. MPLAB REAL ICE offers significant advantages over competitive emulators including full-speed emulation, run-time variable watches, trace analysis, complex breakpoints, logic probes, a ruggedized probe interface and long (up to three meters) interconnection cables.

29.8 MPLAB ICD 3 In-Circuit Debugger System

The MPLAB ICD 3 In-Circuit Debugger System is Microchip's most cost-effective, high-speed hardware debugger/programmer for Microchip Flash DSC and MCU devices. It debugs and programs PIC Flash microcontrollers and dsPIC DSCs with the powerful, yet easy-to-use graphical user interface of the MPLAB IDE.

The MPLAB ICD 3 In-Circuit Debugger probe is connected to the design engineer's PC using a high-speed USB 2.0 interface and is connected to the target with a connector compatible with the MPLAB ICD 2 or MPLAB REAL ICE systems (RJ-11). MPLAB ICD 3 supports all MPLAB ICD 2 headers.

29.9 PICkit 3 In-Circuit Debugger/Programmer

The MPLAB PICkit 3 allows debugging and programming of PIC and dsPIC Flash microcontrollers at a most affordable price point using the powerful graphical user interface of the MPLAB IDE. The MPLAB PICkit 3 is connected to the design engineer's PC using a full-speed USB interface and can be connected to the target via a Microchip debug (RJ-11) connector (compatible with MPLAB ICD 3 and MPLAB REAL ICE). The connector uses two device I/O pins and the Reset line to implement in-circuit debugging and In-Circuit Serial Programming™ (ICSP™).

29.10 MPLAB PM3 Device Programmer

The MPLAB PM3 Device Programmer is a universal, CE compliant device programmer with programmable voltage verification at VDDMIN and VDDMAX for maximum reliability. It features a large LCD display (128 x 64) for menus and error messages, and a modular, detachable socket assembly to support various package types. The ICSP cable assembly is included as a standard item. In Stand-Alone mode, the MPLAB PM3 Device Programmer can read, verify and program PIC devices without a PC connection. It can also set code protection in this mode. The MPLAB PM3 connects to the host PC via an RS-232 or USB cable. The MPLAB PM3 has high-speed communications and optimized algorithms for quick programming of large memory devices, and incorporates an MMC card for file storage and data applications.

TABLE 30-11: DC CHARACTERISTICS: I/O PIN INPUT SPECIFICATIONS (CONTINUED)

DC CHARACTERISTICS			Standard Operating Conditions: 3.0V to 3.6V (unless otherwise stated) Operating temperature -40°C ≤ TA ≤ +85°C for Industrial -40°C ≤ TA ≤ +125°C for Extended				
Param No.	Symbol	Characteristic	Min.	Typ.	Max.	Units	Conditions
DI60a	IICL	Input Low Injection Current	0	—	-5 ^(4,7)	mA	All pins except VDD, VSS, AVDD, AVSS, MCLR, VCAP and RB7
DI60b	IICH	Input High Injection Current	0	—	+5 ^(5,6,7)	mA	All pins except VDD, VSS, AVDD, AVSS, MCLR, VCAP, RB7 and all 5V tolerant pins ⁽⁶⁾
DI60c	ΣIICT	Total Input Injection Current (sum of all I/O and control pins)	-20 ⁽⁸⁾	—	+20 ⁽⁸⁾	mA	Absolute instantaneous sum of all ± input injection currents from all I/O pins (IICL + IICH) ≤ ΣIICT

- Note 1:** The leakage current on the MCLR pin is strongly dependent on the applied voltage level. The specified levels represent normal operating conditions. Higher leakage current can be measured at different input voltages.
- 2:** Negative current is defined as current sourced by the pin.
- 3:** See the “Pin Diagrams” section for the 5V tolerant I/O pins.
- 4:** VIL source < (Vss – 0.3). Characterized but not tested.
- 5:** Non-5V tolerant pins VIH source > (VDD + 0.3), 5V tolerant pins VIH source > 5.5V. Characterized but not tested.
- 6:** Digital 5V tolerant pins cannot tolerate any “positive” input injection current from input sources > 5.5V.
- 7:** Non-zero injection currents can affect the ADC results by approximately 4-6 counts.
- 8:** Any number and/or combination of I/O pins not excluded under IICL or IICH conditions are permitted provided the mathematical “absolute instantaneous” sum of the input injection currents from all pins do not exceed the specified limit. Characterized but not tested.

TABLE 30-18: PLL CLOCK TIMING SPECIFICATIONS

AC CHARACTERISTICS			Standard Operating Conditions: 3.0V to 3.6V (unless otherwise stated)				
Param No.	Symbol	Characteristic	Min.	Typ. ⁽¹⁾	Max.	Units	Conditions
OS50	FPLL1	PLL Voltage Controlled Oscillator (VCO) Input Frequency Range	0.8	—	8.0	MHz	ECPLL, XTPLL modes
OS51	FVCO	On-Chip VCO System Frequency	120	—	340	MHz	
OS52	TLOCK	PLL Start-up Time (Lock Time)	0.9	1.5	3.1	ms	
OS53	DCLK	CLKO Stability (Jitter) ⁽²⁾	-3	0.5	3	%	

Note 1: Data in "Typical" column is at 3.3V, +25°C unless otherwise stated. Parameters are for design guidance only and are not tested.

2: This jitter specification is based on clock cycle-by-clock cycle measurements. To get the effective jitter for individual time bases, or communication clocks used by the application, use the following formula:

$$\text{Effective Jitter} = \frac{DCLK}{\sqrt{\frac{FOSC}{\text{Time Base or Communication Clock}}}}$$

For example, if Fosc = 120 MHz and the SPIx bit rate = 10 MHz, the effective jitter is as follows:

$$\text{Effective Jitter} = \frac{DCLK}{\sqrt{\frac{120}{10}}} = \frac{DCLK}{\sqrt{12}} = \frac{DCLK}{3.464}$$

TABLE 30-19: INTERNAL FRC ACCURACY

AC CHARACTERISTICS		Standard Operating Conditions: 3.0V to 3.6V (unless otherwise stated)					
Param No.	Characteristic	Min.	Typ.	Max.	Units	Conditions	
Internal FRC Accuracy @ FRC Frequency = 7.37 MHz⁽¹⁾							
F20a	FRC	-1.5	0.5	+1.5	%	-40°C ≤ TA ≤ -10°C	VDD = 3.0-3.6V
		-1	0.5	+1	%	-10°C ≤ TA ≤ +85°C	VDD = 3.0-3.6V
F20b	FRC	-2	1	+2	%	+85°C ≤ TA ≤ +125°C	VDD = 3.0-3.6V

Note 1: Frequency is calibrated at +25°C and 3.3V. TUNx bits can be used to compensate for temperature drift.

TABLE 30-20: INTERNAL LPRC ACCURACY

AC CHARACTERISTICS		Standard Operating Conditions: 3.0V to 3.6V (unless otherwise stated)					
Param No.	Characteristic	Min.	Typ.	Max.	Units	Conditions	
LPRC @ 32.768 kHz⁽¹⁾							
F21a	LPRC	-30	—	+30	%	-40°C ≤ TA ≤ -10°C	VDD = 3.0-3.6V
		-20	—	+20	%	-10°C ≤ TA ≤ +85°C	VDD = 3.0-3.6V
F21b	LPRC	-30	—	+30	%	+85°C ≤ TA ≤ +125°C	VDD = 3.0-3.6V

Note 1: The change of LPRC frequency as VDD changes.

NOTES:

33.1 Package Marking Information (Continued)

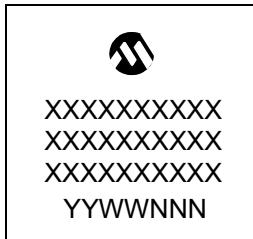

36-Lead VTLA (TLA)

Example

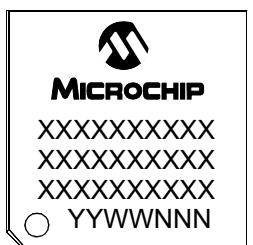

44-Lead VTLA (TLA)

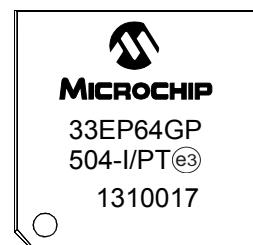

Example

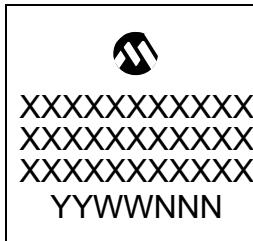

44-Lead TQFP

Example

44-Lead QFN (8x8x0.9 mm)

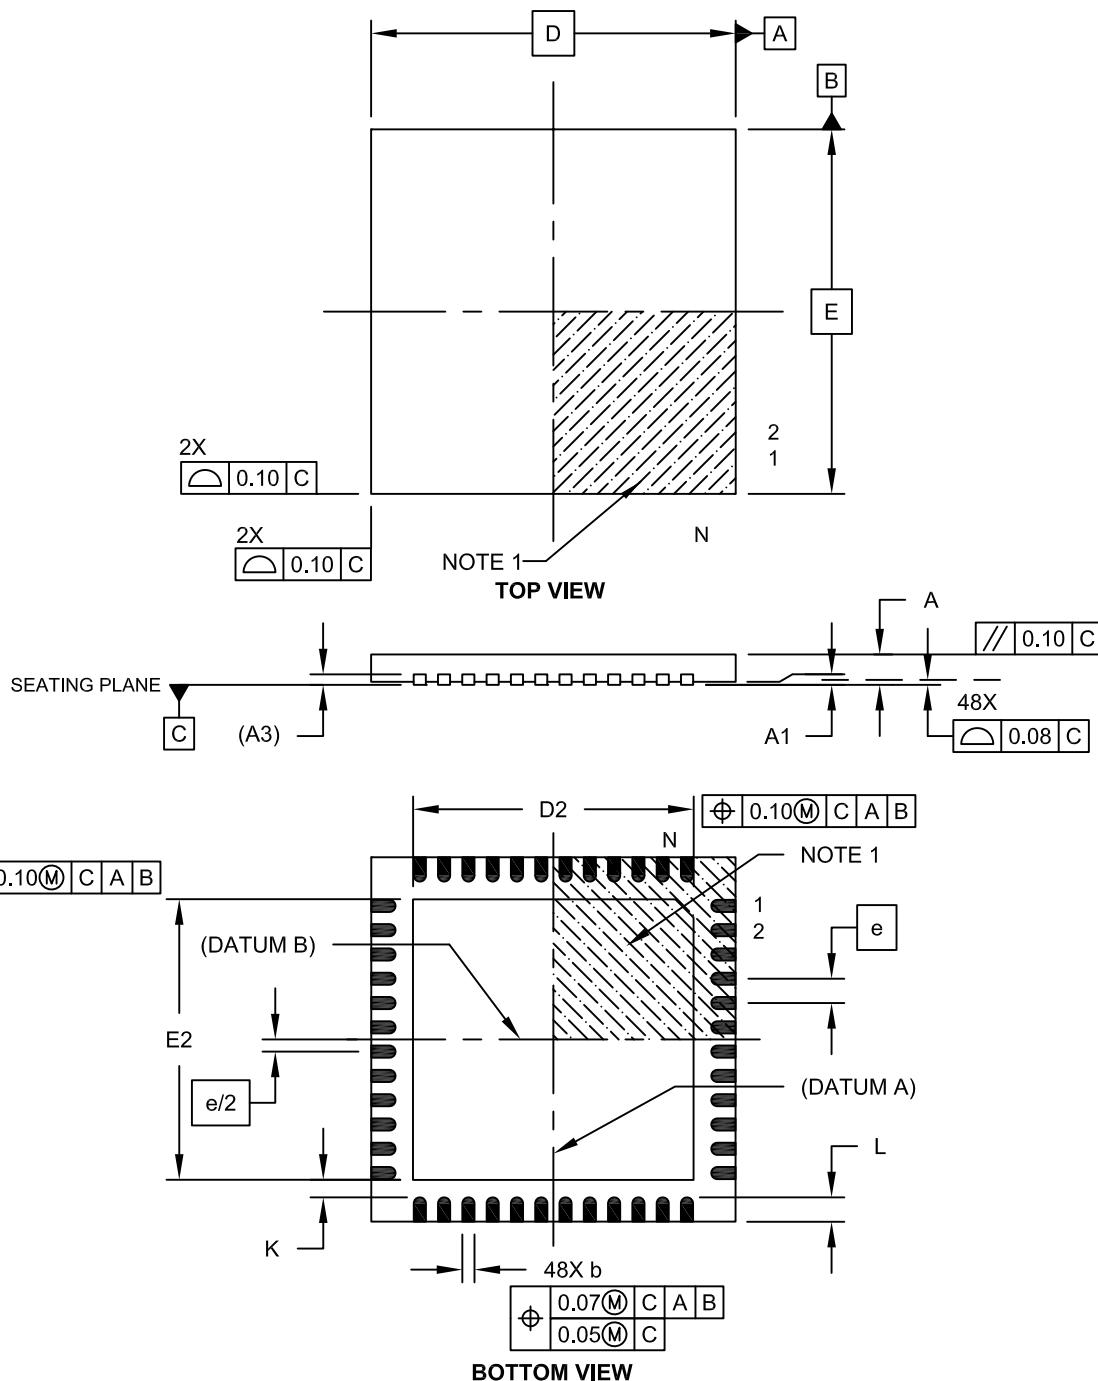

Example

48-Lead Plastic Ultra Thin Quad Flat, No Lead Package (MV) – 6x6x0.5 mm Body [UQFN]
