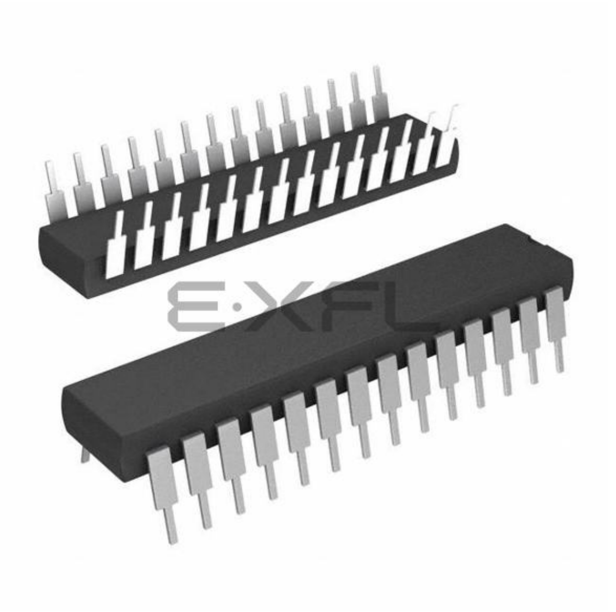
Microchip Technology - DSPIC33EP32MC202-E/SP Datasheet



Welcome to E-XFL.COM

What is "Embedded - Microcontrollers"?

"Embedded - Microcontrollers" refer to small, integrated circuits designed to perform specific tasks within larger systems. These microcontrollers are essentially compact computers on a single chip, containing a processor core, memory, and programmable input/output peripherals. They are called "embedded" because they are embedded within electronic devices to control various functions, rather than serving as standalone computers. Microcontrollers are crucial in modern electronics, providing the intelligence and control needed for a wide range of applications.

Applications of "Embedded - Microcontrollers"

Details	
Product Status	Active
Core Processor	dsPIC
Core Size	16-Bit
Speed	60 MIPs
Connectivity	I²C, IrDA, LINbus, QEI, SPI, UART/USART
Peripherals	Brown-out Detect/Reset, DMA, Motor Control PWM, POR, PWM, WDT
Number of I/O	21
Program Memory Size	32KB (10.7K x 24)
Program Memory Type	FLASH
EEPROM Size	-
RAM Size	2K x 16
Voltage - Supply (Vcc/Vdd)	3V ~ 3.6V
Data Converters	A/D 6x10b/12b
Oscillator Type	Internal
Operating Temperature	-40°C ~ 125°C (TA)
Mounting Type	Through Hole
Package / Case	28-DIP (0.300", 7.62mm)
Supplier Device Package	28-SPDIP
Purchase URL	https://www.e-xfl.com/product-detail/microchip-technology/dspic33ep32mc202-e-sp

TO OUR VALUED CUSTOMERS

It is our intention to provide our valued customers with the best documentation possible to ensure successful use of your Microchip products. To this end, we will continue to improve our publications to better suit your needs. Our publications will be refined and enhanced as new volumes and updates are introduced.

If you have any questions or comments regarding this publication, please contact the Marketing Communications Department via E-mail at **docerrors@microchip.com**. We welcome your feedback.

Most Current Data Sheet

To obtain the most up-to-date version of this data sheet, please register at our Worldwide Web site at:

http://www.microchip.com

You can determine the version of a data sheet by examining its literature number found on the bottom outside corner of any page. The last character of the literature number is the version number, (e.g., DS30000000A is version A of document DS30000000).

Errata

An errata sheet, describing minor operational differences from the data sheet and recommended workarounds, may exist for current devices. As device/documentation issues become known to us, we will publish an errata sheet. The errata will specify the revision of silicon and revision of document to which it applies.

To determine if an errata sheet exists for a particular device, please check with one of the following:

- Microchip's Worldwide Web site; **http://www.microchip.com**
- Your local Microchip sales office (see last page)

When contacting a sales office, please specify which device, revision of silicon and data sheet (include literature number) you are using.

Customer Notification System

Register on our web site at **www.microchip.com** to receive the most current information on all of our products.

5.2 RTSP Operation

RTSP allows the user application to erase a single page of memory and to program two instruction words at a time. See the General Purpose and Motor Control Family tables (Table 1 and Table 2, respectively) for the page sizes of each device.

For more information on erasing and programming Flash memory, refer to **"Flash Programming"** (DS70609) in the *"dsPIC33/PIC24 Family Reference Manual"*.

5.3 Programming Operations

A complete programming sequence is necessary for programming or erasing the internal Flash in RTSP mode. The processor stalls (waits) until the programming operation is finished.

For erase and program times, refer to Parameters D137a and D137b (Page Erase Time), and D138a and D138b (Word Write Cycle Time) in Table 30-14 in **Section 30.0 "Electrical Characteristics"**.

Setting the WR bit (NVMCON<15>) starts the operation and the WR bit is automatically cleared when the operation is finished.

5.3.1 PROGRAMMING ALGORITHM FOR FLASH PROGRAM MEMORY

Programmers can program two adjacent words (24 bits x 2) of program Flash memory at a time on every other word address boundary (0x000002, 0x000006, 0x00000A, etc.). To do this, it is necessary to erase the page that contains the desired address of the location the user wants to change.

For protection against accidental operations, the write initiate sequence for NVMKEY must be used to allow any erase or program operation to proceed. After the programming command has been executed, the user application must wait for the programming time until programming is complete. The two instructions following the start of the programming sequence should be `NOP`s.

Refer to **Flash Programming"** (DS70609) in the "*dsPIC33/PIC24 Family Reference Manual*" for details and codes examples on programming using RTSP.

5.4 Flash Memory Resources

Many useful resources are provided on the main product page of the Microchip web site for the devices listed in this data sheet. This product page, which can be accessed using this link, contains the latest updates and additional information.

> **Note:** In the event you are not able to access the product page using the link above, enter this URL in your browser:
> http://www.microchip.com/wwwproducts/Devices.aspx?dDocName=en555464

- Development Tools

5.5 Control Registers

Four SFRs are used to erase and write the program Flash memory: NVMCON, NVMKEY, NVMADRH and NVMADRL.

The NVMCON register (Register 5-1) enables and initiates Flash memory erase and write operations.

NVMKEY (Register 5-4) is a write-only register that is used for write protection. To start a programming or erase sequence, the user application must consecutively write 0x55 and 0xAA to the NVMKEY register.

There are two NVM Address registers: NVMADRH and NVMADRL. These two registers, when concatenated, form the 24-bit Effective Address (EA) of the selected word for programming operations or the selected page for erase operations.

The NVMADRH register is used to hold the upper 8 bits of the EA, while the NVMADRL register is used to hold the lower 16 bits of the EA.

REGISTER 8-1: DMAxCON: DMA CHANNEL x CONTROL REGISTER

R/W-0	R/W-0	R/W-0	R/W-0	R/W-0	U-0	U-0	U-0
CHEN	SIZE	DIR	HALF	NULLW	—	—	—
bit 15							bit 8

U-0	U-0	R/W-0	R/W-0	U-0	U-0	R/W-0	R/W-0
—	—	AMODE1	AMODE0	—	—	MODE1	MODE0
bit 7							bit 0

Legend:

R = Readable bit
W = Writable bit
U = Unimplemented bit, read as ‘0’
-n = Value at POR
‘1’ = Bit is set
‘0’ = Bit is cleared
x = Bit is unknown

bit 15	**CHEN:** DMA Channel Enable bit `1` = Channel is enabled `0` = Channel is disabled
bit 14	**SIZE:** DMA Data Transfer Size bit `1` = Byte `0` = Word
bit 13	**DIR:** DMA Transfer Direction bit (source/destination bus select) `1` = Reads from RAM address, writes to peripheral address `0` = Reads from peripheral address, writes to RAM address
bit 12	**HALF:** DMA Block Transfer Interrupt Select bit `1` = Initiates interrupt when half of the data has been moved `0` = Initiates interrupt when all of the data has been moved
bit 11	**NULLW:** Null Data Peripheral Write Mode Select bit `1` = Null data write to peripheral in addition to RAM write (DIR bit must also be clear) `0` = Normal operation
bit 10-6	**Unimplemented:** Read as ‘`0`’
bit 5-4	**AMODE<1:0>:** DMA Channel Addressing Mode Select bits `11` = Reserved `10` = Peripheral Indirect Addressing mode `01` = Register Indirect without Post-Increment mode `00` = Register Indirect with Post-Increment mode
bit 3-2	**Unimplemented:** Read as ‘`0`’
bit 1-0	**MODE<1:0>:** DMA Channel Operating Mode Select bits `11` = One-Shot, Ping-Pong modes are enabled (one block transfer from/to each DMA buffer) `10` = Continuous, Ping-Pong modes are enabled `01` = One-Shot, Ping-Pong modes are disabled `00` = Continuous, Ping-Pong modes are disabled

REGISTER 8-9: DSADRH: DMA MOST RECENT RAM HIGH ADDRESS REGISTER

U-0	U-0	U-0	U-0	U-0	U-0	U-0	U-0
—	—	—	—	—	—	—	—

bit 15-0	**DSADR<15:0>:** Most Recent DMA Address Accessed by DMA bits

REGISTER 8-14: DMAPPS: DMA PING-PONG STATUS REGISTER

U-0	U-0	U-0	U-0	U-0	U-0	U-0	U-0
—	—	—	—	—	—	—	—
bit 15							bit 8

U-0	U-0	U-0	U-0	R-0	R-0	R-0	R-0
—	—	—	—	PPST3	PPST2	PPST1	PPST0
bit 7							bit 0

Legend:			
R = Readable bit	W = Writable bit	U = Unimplemented bit, read as ‘0’	
-n = Value at POR	‘1’ = Bit is set	‘0’ = Bit is cleared	x = Bit is unknown

bit 15-4 **Unimplemented:** Read as ‘`0`’

bit 3 **PPST3:** DMA Channel 3 Ping-Pong Mode Status Flag bit

`1` = DMASTB3 register is selected
`0` = DMASTA3 register is selected

bit 2 **PPST2:** DMA Channel 2 Ping-Pong Mode Status Flag bit

`1` = DMASTB2 register is selected
`0` = DMASTA2 register is selected

bit 1 **PPST1:** DMA Channel 1 Ping-Pong Mode Status Flag bit

`1` = DMASTB1 register is selected
`0` = DMASTA1 register is selected

bit 0 **PPST0:** DMA Channel 0 Ping-Pong Mode Status Flag bit

`1` = DMASTB0 register is selected
`0` = DMASTA0 register is selected

REGISTER 9-1: OSCCON: OSCILLATOR CONTROL REGISTER[1] (CONTINUED)

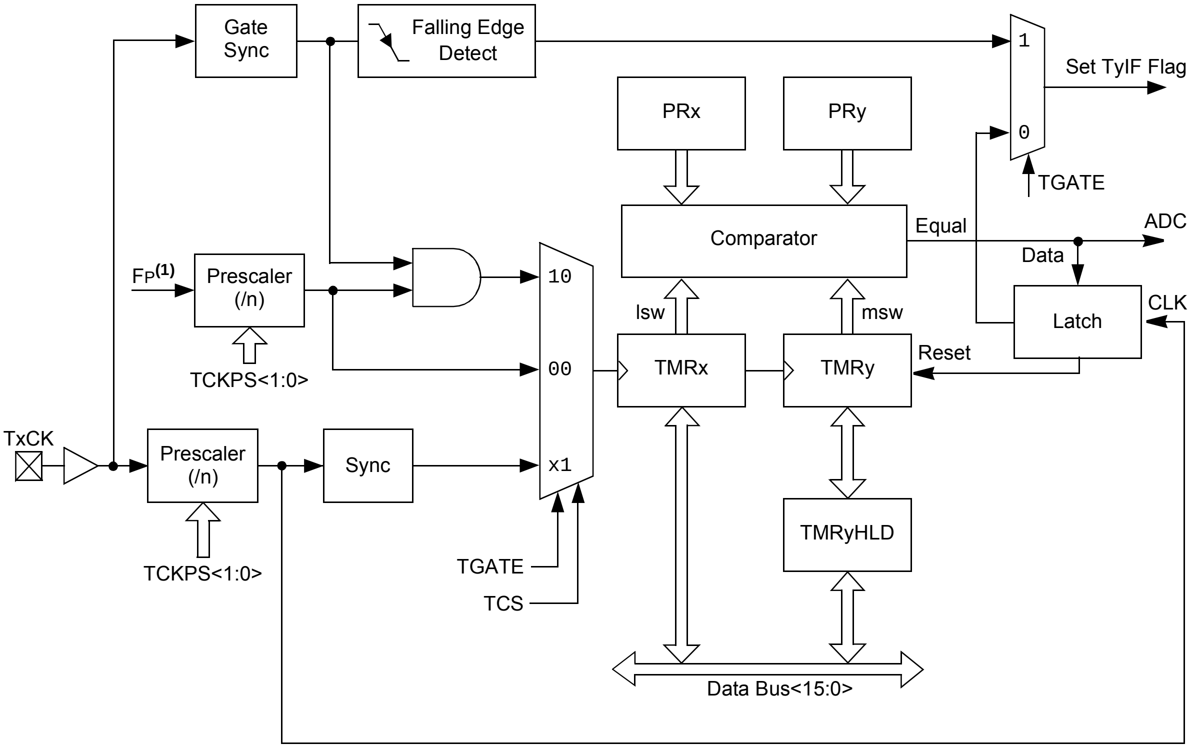
bit 4	**Unimplemented:** Read as '`0`'
bit 3	**CF:** Clock Fail Detect bit[3] `1` = FSCM has detected clock failure `0` = FSCM has not detected clock failure
bit 2-1	**Unimplemented:** Read as '`0`'
bit 0	**OSWEN:** Oscillator Switch Enable bit `1` = Requests oscillator switch to selection specified by the NOSC<2:0> bits `0` = Oscillator switch is complete

Note 1: Writes to this register require an unlock sequence. Refer to **"Oscillator"** (DS70580) in the *"dsPIC33/PIC24 Family Reference Manual"* (available from the Microchip web site) for details.

2: Direct clock switches between any primary oscillator mode with PLL and FRCPLL mode are not permitted. This applies to clock switches in either direction. In these instances, the application must switch to FRC mode as a transitional clock source between the two PLL modes.

3: This bit should only be cleared in software. Setting the bit in software (= `1`) will have the same effect as an actual oscillator failure and trigger an oscillator failure trap.

FIGURE 13-3: TYPE B/TYPE C TIMER PAIR BLOCK DIAGRAM (32-BIT TIMER)



Note 1: The ADC trigger is available on the TMR3:TMR2 andTMR5:TMR4 32-bit timer pairs.

2: Timerx is a Type B timer (x = 2 and 4).

3: Timery is a Type C timer (y = 3 and 5).

13.1 Timerx/y Resources

Many useful resources are provided on the main product page of the Microchip web site for the devices listed in this data sheet. This product page, which can be accessed using this link, contains the latest updates and additional information.

REGISTER 19-2: I2CxSTAT: I2Cx STATUS REGISTER (CONTINUED)

bit 3	**S:** Start bit `1` = Indicates that a Start (or Repeated Start) bit has been detected last `0` = Start bit was not detected last Hardware is set or clear when a Start, Repeated Start or Stop is detected.
bit 2	**R_W:** Read/Write Information bit (when operating as I^{2}C slave) `1` = Read – Indicates data transfer is output from the slave `0` = Write – Indicates data transfer is input to the slave Hardware is set or clear after reception of an I^{2}C device address byte.
bit 1	**RBF:** Receive Buffer Full Status bit `1` = Receive is complete, I2CxRCV is full `0` = Receive is not complete, I2CxRCV is empty Hardware is set when I2CxRCV is written with a received byte. Hardware is clear when software reads I2CxRCV.
bit 0	**TBF:** Transmit Buffer Full Status bit `1` = Transmit in progress, I2CxTRN is full `0` = Transmit is complete, I2CxTRN is empty Hardware is set when software writes to I2CxTRN. Hardware is clear at completion of a data transmission.

NOTES:

23.2 ADC Helpful Tips

1. The SMPIx control bits in the AD1CON2 register:
    a) Determine when the ADC interrupt flag is set and an interrupt is generated, if enabled.
    b) When the CSCNA bit in the AD1CON2 registers is set to '`1`', this determines when the ADC analog scan channel list, defined in the AD1CSSL/AD1CSSH registers, starts over from the beginning.
    c) When the DMA peripheral is not used (ADDMAEN = `0`), this determines when the ADC Result Buffer Pointer to ADC1BUF0-ADC1BUFF gets reset back to the beginning at ADC1BUF0.
    d) When the DMA peripheral is used (ADDMAEN = `1`), this determines when the DMA Address Pointer is incremented after a sample/conversion operation. ADC1BUF0 is the only ADC buffer used in this mode. The ADC Result Buffer Pointer to ADC1BUF0-ADC1BUFF gets reset back to the beginning at ADC1BUF0. The DMA address is incremented after completion of every 32nd sample/conversion operation. Conversion results are stored in the ADC1BUF0 register for transfer to RAM using DMA.
2. When the DMA module is disabled (ADDMAEN = `0`), the ADC has 16 result buffers. ADC conversion results are stored sequentially in ADC1BUF0-ADC1BUFF, regardless of which analog inputs are being used subject to the SMPIx bits and the condition described in 1c) above. There is no relationship between the ANx input being measured and which ADC buffer (ADC1BUF0-ADC1BUFF) that the conversion results will be placed in.
3. When the DMA module is enabled (ADDMAEN = `1`), the ADC module has only 1 ADC result buffer (i.e., ADC1BUF0) per ADC peripheral and the ADC conversion result must be read, either by the CPU or DMA Controller, before the next ADC conversion is complete to avoid overwriting the previous value.
4. The DONE bit (AD1CON1<0>) is only cleared at the start of each conversion and is set at the completion of the conversion, but remains set indefinitely, even through the next sample phase until the next conversion begins. If application code is monitoring the DONE bit in any kind of software loop, the user must consider this behavior because the CPU code execution is faster than the ADC. As a result, in Manual Sample mode, particularly where the user's code is setting the SAMP bit (AD1CON1<1>), the DONE bit should also be cleared by the user application just before setting the SAMP bit.
5. Enabling op amps, comparator inputs and external voltage references can limit the availability of analog inputs (ANx pins). For example, when Op Amp 2 is enabled, the pins for AN0, AN1 and AN2 are used by the op amp's inputs and output. This negates the usefulness of Alternate Input mode since the MUXA selections use AN0-AN2. Carefully study the ADC block diagram to determine the configuration that will best suit your application. Configuration examples are available in the **"Analog-to-Digital Converter (ADC)"** (DS70621) section in the *"dsPIC33/PIC24 Family Reference Manual"*.

23.3 ADC Resources

Many useful resources are provided on the main product page of the Microchip web site for the devices listed in this data sheet. This product page, which can be accessed using this link, contains the latest updates and additional information.

Param No.	**Symbol**	**Characteristic**	**Min.**	**Typ.**	**Max.**	**Units**	**Conditions**
	I_{IL}	**Input Leakage Current[1,2]**					
DI50		I/O Pins 5V Tolerant[3]	-1	—	+1	μA	$V_{SS} \le V_{PIN} \le V_{DD}$, Pin at high-impedance
DI51		I/O Pins Not 5V Tolerant[3]	-1	—	+1	μA	$V_{SS} \le V_{PIN} \le V_{DD}$, Pin at high-impedance, -40°C ≤ T_A ≤ +85°C
DI51a		I/O Pins Not 5V Tolerant[3]	-1	—	+1	μA	Analog pins shared with external reference pins, -40°C ≤ T_A ≤ +85°C
DI51b		I/O Pins Not 5V Tolerant[3]	-1	—	+1	μA	$V_{SS} \le V_{PIN} \le V_{DD}$, Pin at high-impedance, -40°C ≤ T_A ≤ +125°C
DI51c		I/O Pins Not 5V Tolerant[3]	-1	—	+1	μA	Analog pins shared with external reference pins, -40°C ≤ T_A ≤ +125°C
DI55		$\overline{\text{MCLR}}$	-5	—	+5	μA	$V_{SS} \le V_{PIN} \le V_{DD}$
DI56		OSC1	-5	—	+5	μA	$V_{SS} \le V_{PIN} \le V_{DD}$, XT and HS modes

Note 1: The leakage current on the $\overline{\text{MCLR}}$ pin is strongly dependent on the applied voltage level. The specified levels represent normal operating conditions. Higher leakage current can be measured at different input voltages.

2: Negative current is defined as current sourced by the pin.

3: See the **"Pin Diagrams"** section for the 5V tolerant I/O pins.

4: V_{IL} source < (V_{SS} – 0.3). Characterized but not tested.

5: Non-5V tolerant pins V_{IH} source > (V_{DD} + 0.3), 5V tolerant pins V_{IH} source > 5.5V. Characterized but not tested.

6: Digital 5V tolerant pins cannot tolerate any "positive" input injection current from input sources > 5.5V.

7: Non-zero injection currents can affect the ADC results by approximately 4-6 counts.

8: Any number and/or combination of I/O pins not excluded under I_{ICL} or I_{ICH} conditions are permitted provided the mathematical "absolute instantaneous" sum of the input injection currents from all pins do not exceed the specified limit. Characterized but not tested.

31.0 HIGH-TEMPERATURE ELECTRICAL CHARACTERISTICS

This section provides an overview of dsPIC33EPXXXGP50X, dsPIC33EPXXXMC20X/50X and PIC24EPXXXGP/MC20X electrical characteristics for devices operating in an ambient temperature range of -40°C to +150°C.

The specifications between -40°C to +150°C are identical to those shown in **Section 30.0 “Electrical Characteristics”** for operation between -40°C to +125°C, with the exception of the parameters listed in this section.

Parameters in this section begin with an H, which denotes High temperature. For example, Parameter DC10 in **Section 30.0 “Electrical Characteristics”** is the Industrial and Extended temperature equivalent of HDC10.

Absolute maximum ratings for the dsPIC33EPXXXGP50X, dsPIC33EPXXXMC20X/50X and PIC24EPXXXGP/MC20X high-temperature devices are listed below. Exposure to these maximum rating conditions for extended periods can affect device reliability. Functional operation of the device at these or any other conditions above the parameters indicated in the operation listings of this specification is not implied.

Absolute Maximum Ratings(1)

Ambient temperature under bias(2)	-40°C to +150°C
Storage temperature	-65°C to +160°C
Voltage on VDD with respect to VSS	-0.3V to +4.0V
Voltage on any pin that is not 5V tolerant with respect to VSS(3)	-0.3V to (VDD + 0.3V)
Voltage on any 5V tolerant pin with respect to VSS when VDD < 3.0V(3)	-0.3V to 3.6V
Voltage on any 5V tolerant pin with respect to VSS when VDD ≥ 3.0V(3)	-0.3V to 5.5V
Maximum current out of VSS pin	60 mA
Maximum current into VDD pin(4)	60 mA
Maximum junction temperature	+155°C
Maximum current sourced/sunk by any 4x I/O pin	10 mA
Maximum current sourced/sunk by any 8x I/O pin	15 mA
Maximum current sunk by all ports combined	70 mA
Maximum current sourced by all ports combined(4)	70 mA

Note 1: Stresses above those listed under “Absolute Maximum Ratings” can cause permanent damage to the device. This is a stress rating only, and functional operation of the device at those or any other conditions above those indicated in the operation listings of this specification is not implied. Exposure to maximum rating conditions for extended periods can affect device reliability.

2: AEC-Q100 reliability testing for devices intended to operate at +150°C is 1,000 hours. Any design in which the total operating time from +125°C to +150°C will be greater than 1,000 hours is not warranted without prior written approval from Microchip Technology Inc.

3: Refer to the **“Pin Diagrams”** section for 5V tolerant pins.

4: Maximum allowable current is a function of device maximum power dissipation (see Table 31-2).

TABLE 31-8: DC CHARACTERISTICS: I/O PIN OUTPUT SPECIFICATIONS

DC CHARACTERISTICS			**Standard Operating Conditions: 3.0V to 3.6V** **(unless otherwise stated)** Operating temperature -40°C ≤ T_A ≤ +150°C				
Param.	**Symbol**	**Characteristic**	**Min.**	**Typ.**	**Max.**	**Units**	**Conditions**
HDO10	V_{OL}	**Output Low Voltage** 4x Sink Driver Pins(2)	—	—	0.4	V	I_{OL} ≤ 5 mA, V_{DD} = 3.3V **(Note 1)**
		Output Low Voltage 8x Sink Driver Pins(3)	—	—	0.4	V	I_{OL} ≤ 8 mA, V_{DD} = 3.3V **(Note 1)**
HDO20	V_{OH}	**Output High Voltage** 4x Source Driver Pins(2)	2.4	—	—	V	I_{OH} ≥ -10 mA, V_{DD} = 3.3V **(Note 1)**
		Output High Voltage 8x Source Driver Pins(3)	2.4	—	—	V	I_{OH} ≥ 15 mA, V_{DD} = 3.3V **(Note 1)**
HDO20A	V_{OH1}	**Output High Voltage** 4x Source Driver Pins(2)	1.5	—	—	V	I_{OH} ≥ -3.9 mA, V_{DD} = 3.3V **(Note 1)**
			2.0	—	—		I_{OH} ≥ -3.7 mA, V_{DD} = 3.3V **(Note 1)**
			3.0	—	—		I_{OH} ≥ -2 mA, V_{DD} = 3.3V **(Note 1)**
		Output High Voltage 8x Source Driver Pins(3)	1.5	—	—	V	I_{OH} ≥ -7.5 mA, V_{DD} = 3.3V **(Note 1)**
			2.0	—	—		I_{OH} ≥ -6.8 mA, V_{DD} = 3.3V **(Note 1)**
			3.0	—	—		I_{OH} ≥ -3 mA, V_{DD} = 3.3V **(Note 1)**

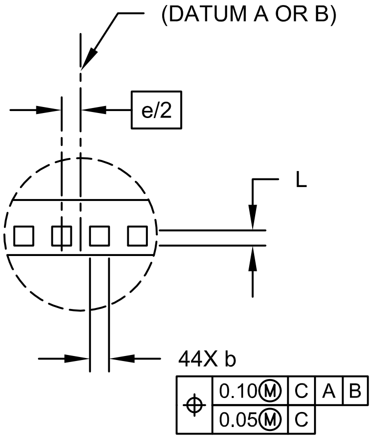
Note 1: Parameters are characterized, but not tested.

2: Includes all I/O pins that are not 8x Sink Driver pins (see below).

3: Includes the following pins:
For devices with less than 64 pins: RA3, RA4, RA9, RB<15:7> and RC3
For 64-pin devices: RA4, RA9, RB<15:7>, RC3 and RC15

44-Terminal Very Thin Leadless Array Package (TL) – 6x6x0.9 mm Body With Exposed Pad [VTLA]

Note:	For the most current package drawings, please see the Microchip Packaging Specification located at http://www.microchip.com/packaging



DETAIL A

	Units	MILLIMETERS		
Dimension	Limits	MIN	NOM	MAX
Number of Pins	N	44		
Number of Pins per Side	ND	12		
Number of Pins per Side	NE	10		
Pitch	e	0.50 BSC		
Overall Height	A	0.80	0.90	1.00
Standoff	A1	0.025	-	0.075
Overall Width	E	6.00 BSC		
Exposed Pad Width	E2	4.40	4.55	4.70
Overall Length	D	6.00 BSC		
Exposed Pad Length	D2	4.40	4.55	4.70
Contact Width	b	0.20	0.25	0.30
Contact Length	L	0.20	0.25	0.30
Contact-to-Exposed Pad	K	0.20	-	-

Notes:

1. Pin 1 visual index feature may vary, but must be located within the hatched area.
2. Package is saw singulated.
3. Dimensioning and tolerancing per ASME Y14.5M.
   BSC: Basic Dimension. Theoretically exact value shown without tolerances.
   REF: Reference Dimension, usually without tolerance, for information purposes only.

Lead Width	b	0.17	0.22	0.27
Mold Draft Angle Top	α	11°	12°	13°
Mold Draft Angle Bottom	β	11°	12°	13°

Notes:

1. Pin 1 visual index feature may vary, but must be located within the hatched area.
2. Chamfers at corners are optional; size may vary.
3. Dimensions D1 and E1 do not include mold flash or protrusions. Mold flash or protrusions shall not exceed 0.25 mm per side.
4. Dimensioning and tolerancing per ASME Y14.5M.
   BSC: Basic Dimension. Theoretically exact value shown without tolerances.
   REF: Reference Dimension, usually without tolerance, for information purposes only.

Microchip Technology Drawing C04-085B

TABLE A-2: MAJOR SECTION UPDATES (CONTINUED)

Section Name	Update Description
Section 30.0 "Electrical Characteristics" (Continued)	These SPI2 Timing Requirements were updated: • Maximum value for Parameter SP10 and the minimum clock period value for SCKx in Note 3 (see Table 30-36, Table 30-37, and Table 30-38) • Maximum value for Parameter SP70 and the minimum clock period value for SCKx in Note 3 (see Table 30-40 and Table 30-42) • The Maximum Data Rate values were updated for the SPI2 Maximum Data/Clock Rate Summary (see Table 30-43) These SPI1 Timing Requirements were updated: • Maximum value for Parameters SP10 and the minimum clock period value for SCKx in Note 3 (see Table 30-44, Table 30-45, and Table 30-46) • Maximum value for Parameters SP70 and the minimum clock period value for SCKx in Note 3 (see Table 30-47 through Table 30-50) • Minimum value for Parameters SP40 and SP41 see Table 30-44 through Table 30-50) Updated all Typical values for the CTMU Current Source Specifications (see Table 30-55). Updated Note1, the Maximum value for Parameter AD06, the Minimum value for AD07, and the Typical values for AD09 in the ADC Module Specifications (see Table 30-56). Added Note 1 to the ADC Module Specifications (12-bit Mode) (see Table 30-57). Added Note 1 to the ADC Module Specifications (10-bit Mode) (see Table 30-58). Updated the Minimum and Maximum values for Parameter AD21b in the 10-bit Mode ADC Module Specifications (see Table 30-58). Updated Note 2 in the ADC Conversion (12-bit Mode) Timing Requirements (see Table 30-59). Updated Note 1 in the ADC Conversion (10-bit Mode) Timing Requirements (see Table 30-60).
