What is "[Embedded - Microcontrollers](#)"?

"[Embedded - Microcontrollers](#)" refer to small, integrated circuits designed to perform specific tasks within larger systems. These microcontrollers are essentially compact computers on a single chip, containing a processor core, memory, and programmable input/output peripherals. They are called "embedded" because they are embedded within electronic devices to control various functions, rather than serving as standalone computers. Microcontrollers are crucial in modern electronics, providing the intelligence and control needed for a wide range of applications.

Details

Product Status	Active
Core Processor	dsPIC
Core Size	16-Bit
Speed	70 MIPS
Connectivity	I ² C, IrDA, LINbus, QEI, SPI, UART/USART
Peripherals	Brown-out Detect/Reset, DMA, Motor Control PWM, POR, PWM, WDT
Number of I/O	21
Program Memory Size	512KB (170K x 24)
Program Memory Type	FLASH
EEPROM Size	-
RAM Size	24K x 16
Voltage - Supply (Vcc/Vdd)	3V ~ 3.6V
Data Converters	A/D 6x10b/12b
Oscillator Type	Internal
Operating Temperature	-40°C ~ 85°C (TA)
Mounting Type	Through Hole
Package / Case	28-DIP (0.300", 7.62mm)
Supplier Device Package	28-SPDIP

14.0 INPUT CAPTURE

Note 1: This data sheet summarizes the features of the dsPIC33EPXXXGP50X, dsPIC33EPXXXMC20X/50X and PIC24EPXXXGP/MC20X families of devices. It is not intended to be a comprehensive reference source. To complement the information in this data sheet, refer to “**Input Capture**” (DS70352) in the “*dsPIC33/dsPIC24 Family Reference Manual*”, which is available from the Microchip web site (www.microchip.com).

2: Some registers and associated bits described in this section may not be available on all devices. Refer to **Section 4.0 “Memory Organization”** in this data sheet for device-specific register and bit information.

The input capture module is useful in applications requiring frequency (period) and pulse measurement. The dsPIC33EPXXXGP50X, dsPIC33EPXXXMC20X/50X and PIC24EPXXXGP/MC20X devices support four input capture channels.

Key features of the input capture module include:

- Hardware-configurable for 32-bit operation in all modes by cascading two adjacent modules
- Synchronous and Trigger modes of output compare operation, with up to 19 user-selectable Trigger/Sync sources available
- A 4-level FIFO buffer for capturing and holding timer values for several events
- Configurable interrupt generation
- Up to six clock sources available for each module, driving a separate internal 16-bit counter

21.0 ENHANCED CAN (ECAN™) MODULE (dsPIC33EPXXXGP/ MC50X DEVICES ONLY)

Note 1: This data sheet summarizes the features of the dsPIC33EPXXXGP50X, dsPIC33EPXXXMC20X/50X and PIC24EPXXXGP/MC20X families of devices. It is not intended to be a comprehensive reference source. To complement the information in this data sheet, refer to “**Enhanced Controller Area Network (ECAN™)**” (DS70353) in the “*dsPIC33/PIC24 Family Reference Manual*”, which is available from the Microchip web site (www.microchip.com).

2: Some registers and associated bits described in this section may not be available on all devices. Refer to **Section 4.0 “Memory Organization”** in this data sheet for device-specific register and bit information.

21.1 Overview

The Enhanced Controller Area Network (ECAN) module is a serial interface, useful for communicating with other CAN modules or microcontroller devices. This interface/protocol was designed to allow communications within noisy environments. The dsPIC33EPXXXGP/MC50X devices contain one ECAN module.

The ECAN module is a communication controller implementing the CAN 2.0 A/B protocol, as defined in the BOSCH CAN specification. The module supports CAN 1.2, CAN 2.0A, CAN 2.0B Passive and CAN 2.0B Active versions of the protocol. The module implementation is a full CAN system. The CAN specification is not covered within this data sheet. The reader can refer to the BOSCH CAN specification for further details.

The ECAN module features are as follows:

- Implementation of the CAN protocol, CAN 1.2, CAN 2.0A and CAN 2.0B
- Standard and extended data frames
- 0-8 bytes data length
- Programmable bit rate up to 1 Mbit/sec
- Automatic response to remote transmission requests
- Up to eight transmit buffers with application specified prioritization and abort capability (each buffer can contain up to 8 bytes of data)
- Up to 32 receive buffers (each buffer can contain up to 8 bytes of data)
- Up to 16 full (Standard/Extended Identifier) acceptance filters
- Three full acceptance filter masks
- DeviceNet™ addressing support
- Programmable wake-up functionality with integrated low-pass filter
- Programmable Loopback mode supports self-test operation
- Signaling via interrupt capabilities for all CAN receiver and transmitter error states
- Programmable clock source
- Programmable link to Input Capture (IC2) module for time-stamping and network synchronization
- Low-power Sleep and Idle mode

The CAN bus module consists of a protocol engine and message buffering/control. The CAN protocol engine handles all functions for receiving and transmitting messages on the CAN bus. Messages are transmitted by first loading the appropriate data registers. Status and errors can be checked by reading the appropriate registers. Any message detected on the CAN bus is checked for errors and then matched against filters to see if it should be received and stored in one of the receive registers.

21.2 Modes of Operation

The ECAN module can operate in one of several operation modes selected by the user. These modes include:

- Initialization mode
- Disable mode
- Normal Operation mode
- Listen Only mode
- Listen All Messages mode
- Loopback mode

Modes are requested by setting the REQOP<2:0> bits (CxCTRL1<10:8>). Entry into a mode is Acknowledged by monitoring the OPMODE<2:0> bits (CxCTRL1<7:5>). The module does not change the mode and the OPMODEx bits until a change in mode is acceptable, generally during bus Idle time, which is defined as at least 11 consecutive recessive bits.

21.3 ECAN Resources

Many useful resources are provided on the main product page of the Microchip web site for the devices listed in this data sheet. This product page, which can be accessed using this link, contains the latest updates and additional information.

Revision H (August 2013)

This revision includes minor typographical and formatting changes throughout the text.

Other major changes are referenced by their respective section in Table A-6.

TABLE A-6: MAJOR SECTION UPDATES

Section Name	Update Description
Cover Section	<ul style="list-style-type: none">• Adds Peripheral Pin Select (PPS) to allow Digital Function Remapping and Change Notification Interrupts to Input/Output section• Adds heading information to 64-Pin TQFP
Section 4.0 “Memory Organization”	<ul style="list-style-type: none">• Corrects Reset values for ANSELE, TRISF, TRISC, ANSELC and TRISA• Corrects address range from 0x2FFF to 0x7FFF• Corrects DSRPAG and DSWPAG (now 3 hex digits)• Changes Call Stack Frame from <15:1> to PC<15:0>• Word length in Figure 4-20 is changed to 50 words for clarity
Section 5.0 “Flash Program Memory”	<ul style="list-style-type: none">• Corrects descriptions of NVM registers
Section 9.0 “Oscillator Configuration”	<ul style="list-style-type: none">• Removes resistor from Figure 9-1• Adds Fast RC Oscillator with Divide-by-16 (FRCDIV16) row to Table 9-1• Removes incorrect information from ROI bit in Register 9-2
Section 14.0 “Input Capture”	<ul style="list-style-type: none">• Changes 31 user-selectable Trigger/Sync interrupts to 19 user-selectable Trigger/Sync interrupts• Corrects ICTSEL<12:10> bits (now ICTSEL<2:0>)
Section 17.0 “Quadrature Encoder Interface (QEI) Module (dsPIC33EPXXXMC20X/50X and PIC24EPXXXMC20X Devices Only)”	<ul style="list-style-type: none">• Corrects QCAPEN bit description
Section 19.0 “Inter-Integrated Circuit™ (I²C™)”	<ul style="list-style-type: none">• Adds note to clarify that 100kbit/sec operation of I²C is not possible at high processor speeds
Section 22.0 “Charge Time Measurement Unit (CTMU)”	<ul style="list-style-type: none">• Clarifies Figure 22-1 to accurately reflect peripheral behavior
Section 23.0 “10-Bit/12-Bit Analog-to-Digital Converter (ADC)”	<ul style="list-style-type: none">• Correct Figure 23-1 (changes CH123x to CH123Sx)
Section 24.0 “Peripheral Trigger Generator (PTG) Module”	<ul style="list-style-type: none">• Adds footnote to Register 24-1 (In order to operate with CVRSS=1, at least one of the comparator modules must be enabled).
Section 25.0 “Op Amp/Comparator Module”	<ul style="list-style-type: none">• Adds note to Figure 25-3 (In order to operate with CVRSS=1, at least one of the comparator modules must be enabled)• Adds footnote to Register 25-2 (COE is not available when OPMODE (CMxCON<10>) = 1)
Section 27.0 “Special Features”	<ul style="list-style-type: none">• Corrects the bit description for FNOSC<2:0>
Section 30.0 “Electrical Characteristics”	<ul style="list-style-type: none">• Corrects 512K part power-down currents based on test data• Corrects WDT timing limits based on LPRC oscillator tolerance
Section 31.0 “High-Temperature Electrical Characteristics”	<ul style="list-style-type: none">• Adds Table 31-5 (DC Characteristics: Idle Current (I_{IDLE}))
