What is "[Embedded - Microcontrollers](#)"?

"[Embedded - Microcontrollers](#)" refer to small, integrated circuits designed to perform specific tasks within larger systems. These microcontrollers are essentially compact computers on a single chip, containing a processor core, memory, and programmable input/output peripherals. They are called "embedded" because they are embedded within electronic devices to control various functions, rather than serving as standalone computers. Microcontrollers are crucial in modern electronics, providing the intelligence and control needed for a wide range of applications.

15.0 OUTPUT COMPARE

- Note 1:** This data sheet summarizes the features of the dsPIC33EPXXXGP50X, dsPIC33EPXXXMC20X/50X and PIC24EPXXXGP/MC20X families of devices. It is not intended to be a comprehensive reference source. To complement the information in this data sheet, refer to “Output Compare” (DS70358) in the “dsPIC33/PIC24 Family Reference Manual”, which is available from the Microchip web site (www.microchip.com).
- 2: Some registers and associated bits described in this section may not be available on all devices. Refer to **Section 4.0 “Memory Organization”** in this data sheet for device-specific register and bit information.

The output compare module can select one of seven available clock sources for its time base. The module compares the value of the timer with the value of one or two compare registers depending on the operating mode selected. The state of the output pin changes when the timer value matches the compare register value. The output compare module generates either a single output pulse or a sequence of output pulses, by changing the state of the output pin on the compare match events. The output compare module can also generate interrupts on compare match events and trigger DMA data transfers.

Note: See “Output Compare” (DS70358) in the “dsPIC33/PIC24 Family Reference Manual” for OCxR and OCxRS register restrictions.

TABLE 30-11: DC CHARACTERISTICS: I/O PIN INPUT SPECIFICATIONS

DC CHARACTERISTICS			Standard Operating Conditions: 3.0V to 3.6V (unless otherwise stated)				
Param No.	Symbol	Characteristic	Min.	Typ.	Max.	Units	Conditions
DI10 DI18 DI19	VIL	Input Low Voltage Any I/O Pin and <u>MCLR</u>	Vss	—	0.2 VDD	V	
		I/O Pins with SDAx, SCLx	Vss	—	0.3 VDD	V	SMBus disabled
		I/O Pins with SDAx, SCLx	Vss	—	0.8	V	SMBus enabled
DI20	VIH	Input High Voltage I/O Pins Not 5V Tolerant	0.8 VDD	—	VDD	V	(Note 3)
		I/O Pins 5V Tolerant and MCLR	0.8 VDD	—	5.5	V	(Note 3)
		I/O Pins with SDAx, SCLx	0.8 VDD	—	5.5	V	SMBus disabled
		I/O Pins with SDAx, SCLx	2.1	—	5.5	V	SMBus enabled
DI30	ICNPU	Change Notification Pull-up Current	150	250	550	μA	VDD = 3.3V, VPIN = VSS
DI31	ICNPD	Change Notification Pull-Down Current⁽⁴⁾	20	50	100	μA	VDD = 3.3V, VPIN = VDD

- Note 1:** The leakage current on the MCLR pin is strongly dependent on the applied voltage level. The specified levels represent normal operating conditions. Higher leakage current can be measured at different input voltages.
- 2:** Negative current is defined as current sourced by the pin.
- 3:** See the “Pin Diagrams” section for the 5V tolerant I/O pins.
- 4:** VIL source < (Vss – 0.3). Characterized but not tested.
- 5:** Non-5V tolerant pins VIH source > (VDD + 0.3), 5V tolerant pins VIH source > 5.5V. Characterized but not tested.
- 6:** Digital 5V tolerant pins cannot tolerate any “positive” input injection current from input sources > 5.5V.
- 7:** Non-zero injection currents can affect the ADC results by approximately 4-6 counts.
- 8:** Any number and/or combination of I/O pins not excluded under IICL or IICH conditions are permitted provided the mathematical “absolute instantaneous” sum of the input injection currents from all pins do not exceed the specified limit. Characterized but not tested.
