

Welcome to E-XFL.COM

What is "Embedded - Microcontrollers"?

"Embedded - Microcontrollers" refer to small, integrated circuits designed to perform specific tasks within larger systems. These microcontrollers are essentially compact computers on a single chip, containing a processor core, memory, and programmable input/output peripherals. They are called "embedded" because they are embedded within electronic devices to control various functions, rather than serving as standalone computers. Microcontrollers are crucial in modern electronics, providing the intelligence and control needed for a wide range of applications.

Applications of "<u>Embedded -</u> <u>Microcontrollers</u>"

Details

Product Status	Obsolete
Core Processor	dsPIC
Core Size	16-Bit
Speed	60 MIPs
Connectivity	I²C, IrDA, LINbus, QEI, SPI, UART/USART
Peripherals	Brown-out Detect/Reset, DMA, Motor Control PWM, POR, PWM, WDT
Number of I/O	21
Program Memory Size	64KB (22K x 24)
Program Memory Type	FLASH
EEPROM Size	-
RAM Size	4K x 16
Voltage - Supply (Vcc/Vdd)	3V ~ 3.6V
Data Converters	A/D 6x10b/12b
Oscillator Type	Internal
Operating Temperature	-40°C ~ 125°C (TA)
Mounting Type	Surface Mount
Package / Case	28-SOIC (0.295", 7.50mm Width)
Supplier Device Package	28-SOIC
Purchase URL	https://www.e-xfl.com/product-detail/microchip-technology/dspic33ep64mc202t-e-so

Email: info@E-XFL.COM

Address: Room A, 16/F, Full Win Commercial Centre, 573 Nathan Road, Mongkok, Hong Kong

10.0 POWER-SAVING FEATURES

- Note 1: This data sheet summarizes the features of the dsPIC33EPXXXGP50X, dsPIC33EPXXXMC20X/50X and PIC24EPXXXGP/MC20X families of devices. It is not intended to be a comprehensive reference source. To complement the information in this data sheet, refer to "Watchdog Timer and Power-Saving Modes" (DS70615) in the "dsPIC33/ PIC24 Family Reference Manual", which is available from the Microchip web site (www.microchip.com).
 - Some registers and associated bits described in this section may not be available on all devices. Refer to Section 4.0 "Memory Organization" in this data sheet for device-specific register and bit information.

The dsPIC33EPXXXGP50X, dsPIC33EPXXXMC20X/ 50X and PIC24EPXXXGP/MC20X devices provide the ability to manage power consumption by selectively managing clocking to the CPU and the peripherals. In general, a lower clock frequency and a reduction in the number of peripherals being clocked constitutes lower consumed power.

dsPIC33EPXXXGP50X, dsPIC33EPXXXMC20X/50X and PIC24EPXXXGP/MC20X devices can manage power consumption in four ways:

- Clock Frequency
- Instruction-Based Sleep and Idle modes
- Software-Controlled Doze mode
- · Selective Peripheral Control in Software

Combinations of these methods can be used to selectively tailor an application's power consumption while still maintaining critical application features, such as timing-sensitive communications.

EXAMPLE 10-1: PWRSAV INSTRUCTION SYNTAX

PWRSAV	#SLEEP_MODE	;	Put	the	device	into	Sleep mode
PWRSAV	#IDLE_MODE	;	Put	the	device	into	Idle mode

10.1 Clock Frequency and Clock Switching

The dsPIC33EPXXXGP50X, dsPIC33EPXXXMC20X/ 50X and PIC24EPXXXGP/MC20X devices allow a wide range of clock frequencies to be selected under application control. If the system clock configuration is not locked, users can choose low-power or highprecision oscillators by simply changing the NOSCx bits (OSCCON<10:8>). The process of changing a system clock during operation, as well as limitations to the process, are discussed in more detail in **Section 9.0 "Oscillator Configuration"**.

10.2 Instruction-Based Power-Saving Modes

The dsPIC33EPXXXGP50X, dsPIC33EPXXXMC20X/ 50X and PIC24EPXXXGP/MC20X devices have two special power-saving modes that are entered through the execution of a special PWRSAV instruction. Sleep mode stops clock operation and halts all code execution. Idle mode halts the CPU and code execution, but allows peripheral modules to continue operation. The assembler syntax of the PWRSAV instruction is shown in Example 10-1.

Note: SLEEP_MODE and IDLE_MODE are constants defined in the assembler include file for the selected device.

Sleep and Idle modes can be exited as a result of an enabled interrupt, WDT time-out or a device Reset. When the device exits these modes, it is said to "wake-up".

24.0 PERIPHERAL TRIGGER GENERATOR (PTG) MODULE

- Note 1: This data sheet summarizes the features of the dsPIC33EPXXXGP50X. dsPIC33EPXXXMC20X/50X and PIC24EPXXXGP/MC20X families of devices. It is not intended to be a comprehensive reference source. To complement the information in this data sheet, refer to "Peripheral Trigger Generator (PTG)" (DS70669) in the "dsPIC33/PIC24 Family Reference Manual", which is available from the Microchip web site (www.microchip.com).
 - 2: Some registers and associated bits described in this section may not be available on all devices. Refer to Section 4.0 "Memory Organization" in this data sheet for device-specific register and bit information.

24.1 Module Introduction

The Peripheral Trigger Generator (PTG) provides a means to schedule complex high-speed peripheral operations that would be difficult to achieve using software. The PTG module uses 8-bit commands, called "Steps", that the user writes to the PTG Queue registers (PTGQUE0-PTGQUE7), which perform operations, such as wait for input signal, generate output trigger and wait for timer.

The PTG module has the following major features:

- Multiple clock sources
- Two 16-bit general purpose timers
- Two 16-bit general limit counters
- Configurable for rising or falling edge triggering
- Generates processor interrupts to include:
 - Four configurable processor interrupts
 - Interrupt on a Step event in Single-Step modeInterrupt on a PTG Watchdog Timer time-out
- Able to receive trigger signals from these peripherals:
 - ADC
 - PWM
 - Output Compare
 - Input Capture
 - Op Amp/Comparator
 - INT2
- Able to trigger or synchronize to these peripherals:
 - Watchdog Timer
 - Output Compare
 - Input Capture
 - ADC
 - PWM
- Op Amp/Comparator

TABLE 30-8: DC CHARACTERISTICS: POWER-DOWN CURRENT (IPD)

Note 1: IPD (Sleep) current is measured as follows:

• CPU core is off, oscillator is configured in EC mode and external clock is active; OSC1 is driven with external square wave from rail-to-rail (EC clock overshoot/undershoot < 250 mV required)

- · CLKO is configured as an I/O input pin in the Configuration Word
- All I/O pins are configured as inputs and pulled to Vss
- MCLR = VDD, WDT and FSCM are disabled
- All peripheral modules are disabled (PMDx bits are all set)
- The VREGS bit (RCON<8>) = 0 (i.e., core regulator is set to standby while the device is in Sleep mode)
- The VREGSF bit (RCON<11>) = 0 (i.e., Flash regulator is set to standby while the device is in Sleep mode)
- JTAG is disabled

TABLE 30-48:SPI1 SLAVE MODE (FULL-DUPLEX, CKE = 0, CKP = 0, SMP = 0)TIMING REQUIREMENTS

Param.	Symbol	Characteristic ⁽¹⁾	Min.	Тур. ⁽²⁾	Max.	Units	Conditions
SP70	FscP	Maximum SCK1 Input Frequency		_	11	MHz	(Note 3)
SP72	TscF	SCK1 Input Fall Time	_		_	ns	See Parameter DO32 (Note 4)
SP73	TscR	SCK1 Input Rise Time	—	—	—	ns	See Parameter DO31 (Note 4)
SP30	TdoF	SDO1 Data Output Fall Time			_	ns	See Parameter DO32 (Note 4)
SP31	TdoR	SDO1 Data Output Rise Time	—	_	_	ns	See Parameter DO31 (Note 4)
SP35	TscH2doV, TscL2doV	SDO1 Data Output Valid after SCK1 Edge	—	6	20	ns	
SP36	TdoV2scH, TdoV2scL	SDO1 Data Output Setup to First SCK1 Edge	30	_	_	ns	
SP40	TdiV2scH, TdiV2scL	Setup Time of SDI1 Data Input to SCK1 Edge	30	_	_	ns	
SP41	TscH2diL, TscL2diL	Hold Time of SDI1 Data Input to SCK1 Edge	30	_	_	ns	
SP50	TssL2scH, TssL2scL	$\overline{SS1}$ ↓ to SCK1 ↑ or SCK1 ↓ Input	120	Ι	—	ns	
SP51	TssH2doZ	SS1 ↑ to SDO1 Output High-Impedance	10	—	50	ns	(Note 4)
SP52	TscH2ssH, TscL2ssH	SS1 ↑ after SCK1 Edge	1.5 Tcy + 40	—	_	ns	(Note 4)

Note 1: These parameters are characterized, but are not tested in manufacturing.

2: Data in "Typical" column is at 3.3V, +25°C unless otherwise stated.

3: The minimum clock period for SCK1 is 91 ns. Therefore, the SCK1 clock generated by the master must not violate this specification.

4: Assumes 50 pF load on all SPI1 pins.

31.0 HIGH-TEMPERATURE ELECTRICAL CHARACTERISTICS

This section provides an overview of dsPIC33EPXXXGP50X, dsPIC33EPXXXMC20X/50X and PIC24EPXXXGP/ MC20X electrical characteristics for devices operating in an ambient temperature range of -40°C to +150°C.

The specifications between -40° C to $+150^{\circ}$ C are identical to those shown in **Section 30.0** "**Electrical Characteristics**" for operation between -40° C to $+125^{\circ}$ C, with the exception of the parameters listed in this section.

Parameters in this section begin with an H, which denotes High temperature. For example, Parameter DC10 in **Section 30.0 "Electrical Characteristics"** is the Industrial and Extended temperature equivalent of HDC10.

Absolute maximum ratings for the dsPIC33EPXXXGP50X, dsPIC33EPXXXMC20X/50X and PIC24EPXXXGP/MC20X high-temperature devices are listed below. Exposure to these maximum rating conditions for extended periods can affect device reliability. Functional operation of the device at these or any other conditions above the parameters indicated in the operation listings of this specification is not implied.

Absolute Maximum Ratings⁽¹⁾

Ambient temperature under bias ⁽²⁾	40°C to +150°C
Storage temperature	-65°C to +160°C
Voltage on VDD with respect to Vss	-0.3V to +4.0V
Voltage on any pin that is not 5V tolerant with respect to Vss ⁽³⁾	-0.3V to (VDD + 0.3V)
Voltage on any 5V tolerant pin with respect to Vss when VDD < 3.0V ⁽³⁾	-0.3V to 3.6V
Voltage on any 5V tolerant pin with respect to Vss when $VDD \ge 3.0V^{(3)}$	-0.3V to 5.5V
Maximum current out of Vss pin	60 mA
Maximum current into VDD pin ⁽⁴⁾	60 mA
Maximum junction temperature	+155°C
Maximum current sourced/sunk by any 4x I/O pin	10 mA
Maximum current sourced/sunk by any 8x I/O pin	
Maximum current sunk by all ports combined	70 mA
Maximum current sourced by all ports combined ⁽⁴⁾	70 mA

- **Note 1:** Stresses above those listed under "Absolute Maximum Ratings" can cause permanent damage to the device. This is a stress rating only, and functional operation of the device at those or any other conditions above those indicated in the operation listings of this specification is not implied. Exposure to maximum rating conditions for extended periods can affect device reliability.
 - 2: AEC-Q100 reliability testing for devices intended to operate at +150°C is 1,000 hours. Any design in which the total operating time from +125°C to +150°C will be greater than 1,000 hours is not warranted without prior written approval from Microchip Technology Inc.
 - 3: Refer to the "Pin Diagrams" section for 5V tolerant pins.
 - 4: Maximum allowable current is a function of device maximum power dissipation (see Table 31-2).

28-Lead Plastic Small Outline (SO) - Wide, 7.50 mm Body [SOIC]

Note: For the most current package drawings, please see the Microchip Packaging Specification located at http://www.microchip.com/packaging

Microchip Technology Drawing C04-052C Sheet 1 of 2

Section Name	Update Description
Section 30.0 "Electrical	These SPI2 Timing Requirements were updated:
Characteristics" (Continued)	 Maximum value for Parameter SP10 and the minimum clock period value for SCKx in Note 3 (see Table 30-36, Table 30-37, and Table 30-38)
	Maximum value for Parameter SP70 and the minimum clock period value for SCKx in Note 3 (see Table 30-40 and Table 30-42)
	The Maximum Data Rate values were updated for the SPI2 Maximum Data/Clock Rate Summary (see Table 30-43)
	These SPI1 Timing Requirements were updated:
	Maximum value for Parameters SP10 and the minimum clock period value for SCKx in Note 3 (see Table 30-44, Table 30-45, and Table 30-46)
	 Maximum value for Parameters SP70 and the minimum clock period value for SCKx in Note 3 (see Table 30-47 through Table 30-50)
	 Minimum value for Parameters SP40 and SP41 see Table 30-44 through Table 30-50)
	Updated all Typical values for the CTMU Current Source Specifications (see Table 30-55).
	Updated Note1, the Maximum value for Parameter AD06, the Minimum value for AD07, and the Typical values for AD09 in the ADC Module Specifications (see Table 30-56).
	Added Note 1 to the ADC Module Specifications (12-bit Mode) (see Table 30-57).
	Added Note 1 to the ADC Module Specifications (10-bit Mode) (see Table 30-58).
	Updated the Minimum and Maximum values for Parameter AD21b in the 10-bit Mode ADC Module Specifications (see Table 30-58).
	Updated Note 2 in the ADC Conversion (12-bit Mode) Timing Requirements (see Table 30-59).
	Updated Note 1 in the ADC Conversion (10-bit Mode) Timing Requirements (see Table 30-60).

TABLE A-2: MAJOR SECTION UPDATES (CONTINUED)

Revision H (August 2013)

This revision includes minor typographical and formatting changes throughout the text.

Other major changes are referenced by their respective section in Table A-6.

TABLE A-6:	MAJOR SECTION UPDATES
------------	-----------------------

Section Name	Update Description
Cover Section	Adds Peripheral Pin Select (PPS) to allow Digital Function Remapping and Change
	Notification Interrupts to Input/Output section
	Adds heading information to 64-Pin TQFP
Section 4.0 "Memory	Corrects Reset values for ANSELE, TRISF, TRISC, ANSELC and TRISA
Organization"	Corrects address range from 0x2FFF to 0x7FFF
	 Corrects DSRPAG and DSWPAG (now 3 hex digits)
	 Changes Call Stack Frame from <15:1> to PC<15:0>
	Word length in Figure 4-20 is changed to 50 words for clarity
Section 5.0 "Flash Program Memory"	Corrects descriptions of NVM registers
Section 9.0 "Oscillator	Removes resistor from Figure 9-1
Configuration"	Adds Fast RC Oscillator with Divide-by-16 (FRCDIV16) row to Table 9-1
	Removes incorrect information from ROI bit in Register 9-2
Section 14.0 "Input Capture"	Changes 31 user-selectable Trigger/Sync interrupts to 19 user-selectable Trigger/ Sync interrupts
	Corrects ICTSEL<12:10> bits (now ICTSEL<2:0>)
Section 17.0 "Quadrature Encoder Interface (QEI)	Corrects QCAPEN bit description
Module	
(dsPIC33EPXXXMC20X/50X	
Devices Only)"	
Section 19.0 "Inter-	Adds note to clarify that 100kbit/sec operation of I ² C is not possible at high processor
Integrated Circuit™ (I ² C™)"	speeds
Section 22.0 "Charge Time Measurement Unit (CTMU)"	Clarifies Figure 22-1 to accurately reflect peripheral behavior
Section 23.0 "10-Bit/12-Bit Analog-to-Digital Converter (ADC)"	Correct Figure 23-1 (changes CH123x to CH123Sx)
Section 24.0 "Peripheral Trigger Generator (PTG) Module"	 Adds footnote to Register 24-1 (In order to operate with CVRSS=1, at least one of the comparator modules must be enabled.
Section 25.0 "Op Amp/ Comparator Module"	• Adds note to Figure 25-3 (In order to operate with CVRSS=1, at least one of the comparator modules must be enabled)
	 Adds footnote to Register 25-2 (COE is not available when OPMODE (CMxCON<10>) = 1)
Section 27.0 "Special Features"	Corrects the bit description for FNOSC<2:0>
Section 30.0 "Electrical	Corrects 512K part power-down currents based on test data
Characteristics"	Corrects WDT timing limits based on LPRC oscillator tolerance
Section 31.0 "High-	Adds Table 31-5 (DC Characteristics: Idle Current (IIDLE)
Temperature Electrical Characteristics"
