

Welcome to [E-XFL.COM](#)

#### What is "[Embedded - Microcontrollers](#)"?

"[Embedded - Microcontrollers](#)" refer to small, integrated circuits designed to perform specific tasks within larger systems. These microcontrollers are essentially compact computers on a single chip, containing a processor core, memory, and programmable input/output peripherals. They are called "embedded" because they are embedded within electronic devices to control various functions, rather than serving as standalone computers. Microcontrollers are crucial in modern electronics, providing the intelligence and control needed for a wide range of applications.

#### Applications of "[Embedded - Microcontrollers](#)"

##### Details

Product Status	Active
Core Processor	dsPIC
Core Size	16-Bit
Speed	70 MIPS
Connectivity	I <sup>2</sup> C, IrDA, LINbus, QEI, SPI, UART/USART
Peripherals	Brown-out Detect/Reset, DMA, I <sup>2</sup> S, Motor Control PWM, POR, PWM, WDT
Number of I/O	85
Program Memory Size	512KB (170K x 24)
Program Memory Type	FLASH
EEPROM Size	-
RAM Size	48K x 8
Voltage - Supply (Vcc/Vdd)	-
Data Converters	A/D 49x10b/12b
Oscillator Type	Internal
Operating Temperature	-40°C ~ 85°C (TA)
Mounting Type	Surface Mount
Package / Case	121-TFBGA
Supplier Device Package	121-TFBGA (10x10)
Purchase URL	<a href="https://www.e-xfl.com/product-detail/microchip-technology/dspic33ep512gm310t-i-bg">https://www.e-xfl.com/product-detail/microchip-technology/dspic33ep512gm310t-i-bg</a>

## 4.3.2 EXTENDED X DATA SPACE

The lower portion of the base address space range, between 0x0000 and 0x7FFF, is always accessible regardless of the contents of the Data Space Page registers. It is indirectly addressable through the register indirect instructions. It can be regarded as being located in the default EDS Page 0 (i.e., EDS address range of 0x000000 to 0x007FFF with the base address bit, EA<15> = 0, for this address range). However, Page 0 cannot be accessed through the upper 32 Kbytes, 0x8000 to 0xFFFF, of Base Data Space, in combination with DSRPAG = 0x000 or DSWPAG = 0x000. Consequently, DSRPAG and DSWPAG are initialized to 0x001 at Reset.

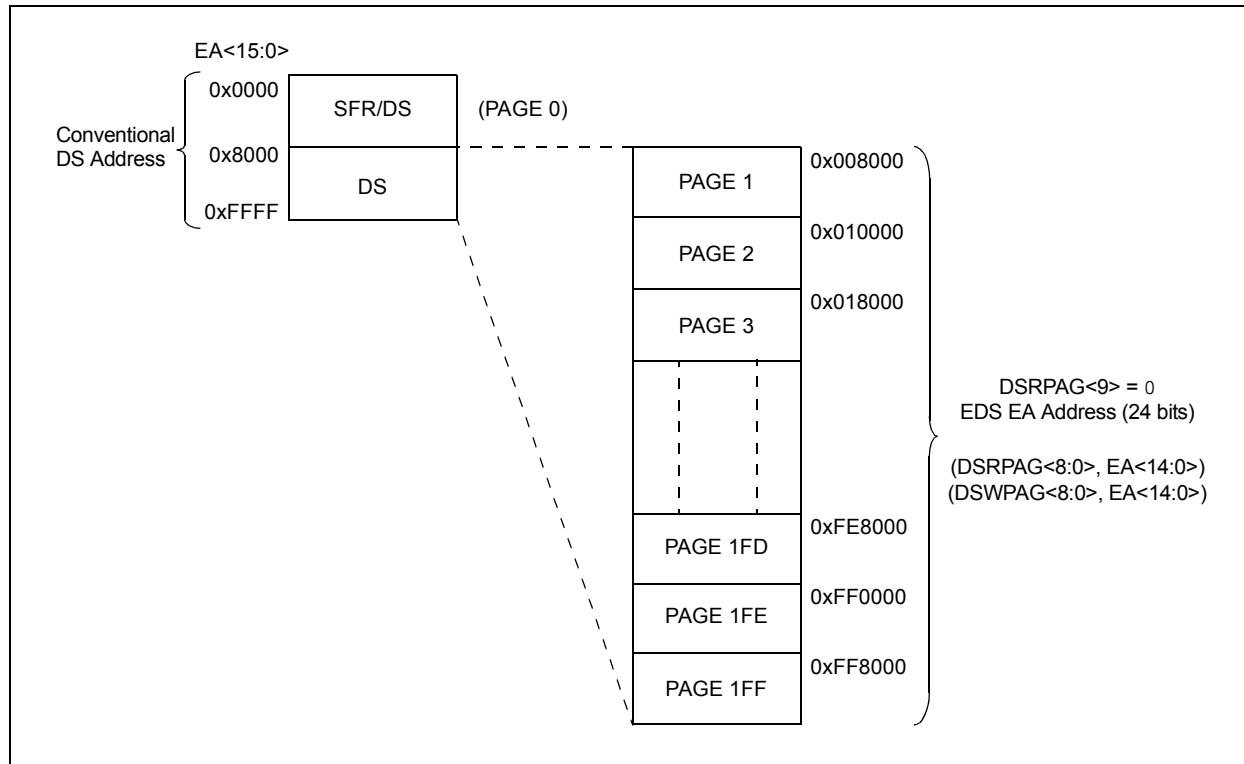

- Note 1:** DSxPAG should not be used to access Page 0. An EDS access with DSxPAG set to 0x000 will generate an address error trap.
- 2:** Clearing the DSxPAG in software has no effect.

The remaining pages, including both EDS and PSV pages, are only accessible using the DSRPAG or DSWPAG register, in combination with the upper 32 Kbytes, 0x8000 to 0xFFFF, of the base address, where the base address bit, EA<15> = 1.

For example, when DSRPAG = 0x001 or DSWPAG = 0x001, accesses to the upper 32 Kbytes, 0x8000 to 0xFFFF, of the Data Space will map to the EDS address range of 0x008000 to 0x00FFFF. When DSRPAG = 0x002 or DSWPAG = 0x002, accesses to the upper 32 Kbytes of the Data Space will map to the EDS address range of 0x010000 to 0x017FFF and so on, as shown in the EDS memory map in Figure 4-11.

For more information on the PSV page access, using Data Space Page registers, refer to the “**Program Space Visibility from Data Space**” section in “**Program Memory**” (DS70613) of the “*dsPIC33/PIC24 Family Reference Manual*”.

**FIGURE 4-11: EDS MEMORY MAP**

## 5.2 RTSP Operation

RTSP allows the user application to erase a single page of memory, program a row and to program two instruction words at a time. See Table 1 in the “**dsPIC33EPXXXGM3XX/6XX/7XX Product Family**” section for the page sizes of each device.

The Flash program memory array is organized into rows of 64 instructions or 192 bytes. RTSP allows the user application to erase a page of program memory, which consists of eight rows (512 instructions) at a time, and to program one row or two adjacent words at a time. The 8-row erase pages and single row write rows are edge-aligned, from the beginning of program memory, on boundaries of 1536 bytes and 192 bytes, respectively.

For more information on erasing and programming Flash memory, refer to the “*dsPIC33/PIC24 Family Reference Manual*”, “**Flash Programming**” (DS70609).

## 5.3 Programming Operations

A complete programming sequence is necessary for programming or erasing the internal Flash in RTSP mode. The processor stalls (waits) until the programming operation is finished.

For erase and program times, refer to Parameters D137a and D137b (Page Erase Time), and D138a and D138b (Word Write Cycle Time), in Table 33-13.

Setting the WR bit (NVMCON<15>) starts the operation and the WR bit is automatically cleared when the operation is finished.

### 5.3.1 PROGRAMMING ALGORITHM FOR FLASH PROGRAM MEMORY

Programmers can program two adjacent words (24 bits x 2) of program Flash memory at a time on every other word address boundary (0x000002, 0x000006, 0x00000A, etc.). To do this, it is necessary to erase the page that contains the desired address of the location the user wants to change. Programmers can also program a row of data (64 instruction words/ 192 bytes) at a time using the row programming feature present in these devices. For row programming, the source data is fetched directly from the data memory (RAM) on these devices. Two new registers have been provided to point to the RAM location where the source data resides. The page that has the row to be programmed must first be erased before the programming operation.

For protection against accidental operations, the write initiate sequence for NVMKEY must be used to allow any erase or program operation to proceed. After the programming command has been executed, the user application must wait for the programming time until programming is complete. The two instructions following the start of the programming sequence should be NOPS.

Refer to the “*dsPIC33/PIC24 Family Reference Manual*”, “**Flash Programming**” (DS70609) for details and code examples on programming using RTSP.

## 5.4 Control Registers

Six SFRs are used to read and write the program Flash memory: NVMCON, NVMKEY, NVMADR, NVMADRU, NVMSRCADRL and NVMSRCADRH.

The NVMCON register (Register 5-1) controls which blocks are to be erased, which memory type is to be programmed and the start of the programming cycle.

NVMKEY (Register 5-4) is a write-only register that is used for write protection. To start a programming or erase sequence, the user application must consecutively write 0x55 and 0xAA to the NVMKEY register.

There are two NVM Address registers: NVMADRU and NVMADR. These two registers, when concatenated, form the 24-bit Effective Address (EA) of the selected word for programming operations, or the selected page for erase operations.

The NVMADRU register is used to hold the upper 8 bits of the EA, while the NVMADR register is used to hold the lower 16 bits of the EA.

The NVMSRCADRH and NVMSRCADRL registers are used to hold the source address of the data in the data memory that needs to be written to Flash memory.

**TABLE 7-1: INTERRUPT VECTOR DETAILS**

Interrupt Source	Vector #	IRQ #	IVT Address	Interrupt Bit Location		
				Flag	Enable	Priority
Highest Natural Order Priority

bit 15-8      **STEP(2x + 1)<7:0>:** PTG Step Queue Pointer Register bits<sup>(2)</sup>

A queue location for storage of the STEP(2x + 1) command byte.

bit 7-0      **STEP(2x)<7:0>:** PTG Step Queue Pointer Register bits<sup>(2)</sup>

A queue location for storage of the STEP(2x) command byte.

**Note 1:** This register is read-only when the PTG module is executing Step commands (PTGEN = 1 and PTGSTRT = 1).

**2:** Refer to Table 25-1 for the Step command encoding.

**3:** The Step registers maintain their values on any type of Reset.

### 25.3 Step Commands and Format

**TABLE 25-1: PTG STEP COMMAND FORMAT**

Step Command Byte:		
STEPx<7:0>		
CMD<3:0>		OPTION<3:0>
bit 7	bit 4	bit 3

bit 7-4	CMD<3:0>	Step Command	Command Description
		0000 PTGCTRL	Execute control command as described by OPTION<3:0>
0001	PTGADD	Add contents of PTGADJ register to target register as described by OPTION<3:0>	
	PTGCOPY	Copy contents of PTGHOLD register to target register as described by OPTION<3:0>	
001x	PTGSTRB	Copy the value contained in CMD0:OPTION<3:0> to the CH0SA<4:0> bits (AD1CHS0<4:0>)	
0100	PTGWHI	Wait for a low-to-high edge input from selected PTG trigger input as described by OPTION<3:0>	
0101	PTGWLO	Wait for a high-to-low edge input from selected PTG trigger input as described by OPTION<3:0>	
0110	Reserved	Reserved	
0111	PTGIRQ	Generate individual interrupt request as described by OPTION<3:0>	
100x	PTGTRIG	Generate individual trigger output as described by <<CMD0>:OPTION<3:0>>	
101x	PTGJMP	Copy the value indicated in <<CMD0>:OPTION<3:0>> to the Queue Pointer (PTGQPTR) and jump to that step queue	
110x	PTGJMPC0	PTGC0 = PTGC0LIM: Increment the Queue Pointer (PTGQPTR)	
		PTGC0 ≠ PTGC0LIM: Increment Counter 0 (PTGC0) and copy the value indicated in <<CMD0>:OPTION<3:0>> to the Queue Pointer (PTGQPTR) and jump to that step queue	
111x	PTGJMPC1	PTGC1 = PTGC1LIM: Increment the Queue Pointer (PTGQPTR)	
		PTGC1 ≠ PTGC1LIM: Increment Counter 1 (PTGC1) and copy the value indicated in <<CMD0>:OPTION<3:0>> to the Queue Pointer (PTGQPTR) and jump to that step queue	

**Note 1:** All reserved commands or options will execute but have no effect (i.e., execute as a NOP instruction).

**2:** Refer to Table 25-2 for the trigger output descriptions.

### 26.1.2 OP AMP CONFIGURATION B

Figure 26-6 shows a typical inverting amplifier circuit with the output of the op amp (OAxOUT) externally routed to a separate analog input pin (ANy) on the device. This op amp configuration is slightly different in terms of the op amp output and the ADCx input connection, therefore, RINT1 is not included in the transfer function. However, this configuration requires the designer to externally route the op amp output (OAxOUT) to another analog input pin (ANy). See Table 33-52 in **Section 33.0 “Electrical Characteristics”** for the typical value of RINT1. Table 33-57 and Table 33-58 in **Section 33.0 “Electrical Characteristics”** describe the minimum sample time (TSAMP) requirements for the ADCx module in this configuration.

Figure 26-6 also defines the equation to be used to calculate the expected voltage at point, VOAxOUT. This is the typical inverting amplifier equation.

### 26.2 Op Amp/Comparator Resources

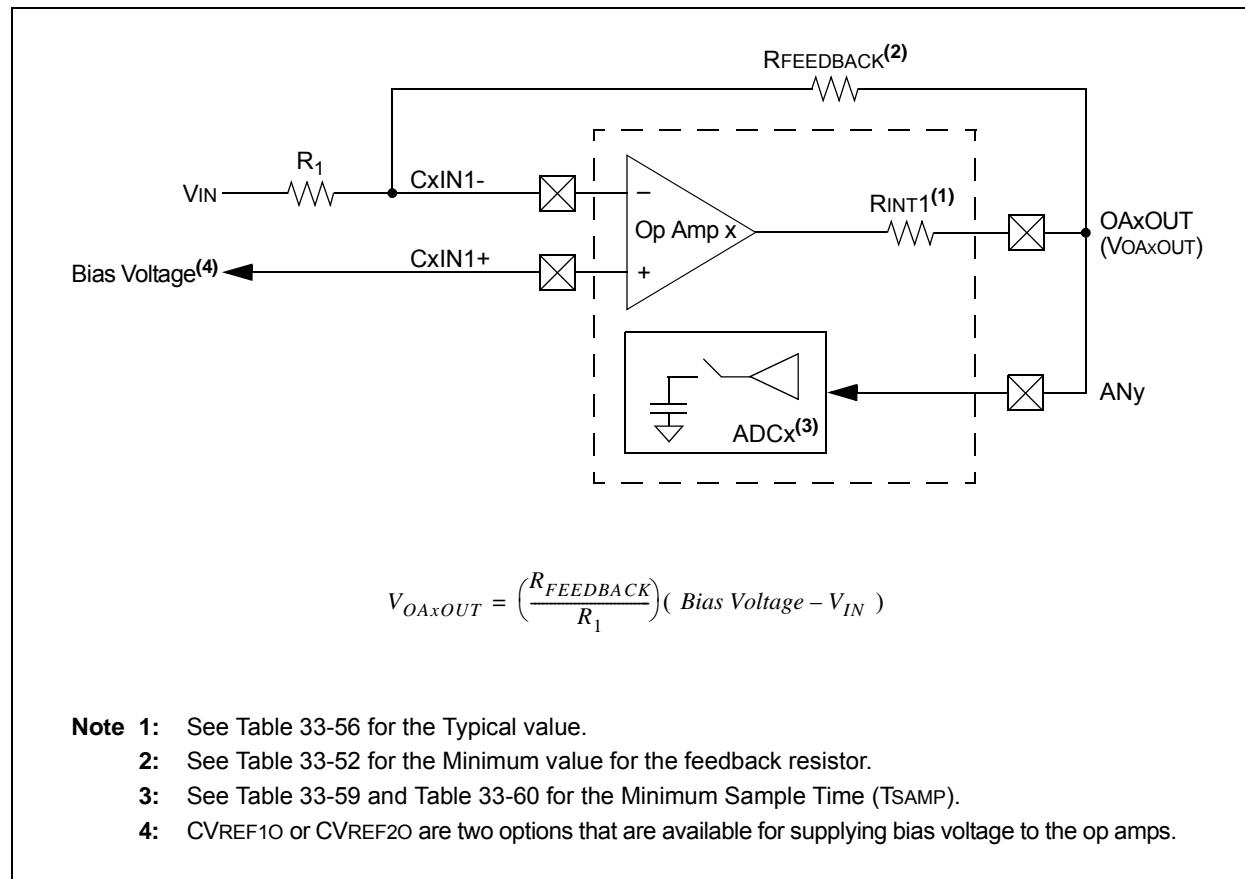

Many useful resources are provided on the main product page of the Microchip web site for the devices listed in this data sheet. This product page, which can be accessed using this link, contains the latest updates and additional information.

**Note:** In the event you are not able to access the product page using the link above, enter this URL in your browser:  
<http://www.microchip.com/wwwproducts/Devices.aspx?dDocName=en555464>

### 26.2.1 KEY RESOURCES

bit 1      **RTSECSEL:** RTCC Seconds Clock Output Select bit<sup>(1)</sup>

  1 = RTCC seconds clock is selected for the RTCC pin

  0 = RTCC alarm pulse is selected for the RTCC pin

bit 0      Not used by the RTCC module.

**Note 1:** To enable the actual RTCC output, the RTCOE bit (RCFGCAL<10>) must be set.

## 30.5 Watchdog Timer (WDT)

For dsPIC33EPXXXGM3XX/6XX/7XX devices, the WDT is driven by the LPRC oscillator. When the WDT is enabled, the clock source is also enabled.

### 30.5.1 PRESCALER/POSTSCALER

The nominal WDT clock source from LPRC is 32 kHz. This feeds a prescaler that can be configured for either 5-bit (divide-by-32) or 7-bit (divide-by-128) operation. The prescaler is set by the WDTPRE Configuration bit. With a 32 kHz input, the prescaler yields a WDT time-out period ( $T_{WDT}$ ), as shown in Parameter SY12 in Table 33-21.

A variable postscaler divides down the WDT prescaler output and allows for a wide range of time-out periods. The postscaler is controlled by the WDTPOST<3:0> Configuration bits (FWDT<3:0>), which allow the selection of 16 settings, from 1:1 to 1:32,768. Using the prescaler and postscaler, time-out periods ranging from 1 ms to 131 seconds can be achieved.

The WDT, prescaler and postscaler are reset:

- On any device Reset
- On the completion of a clock switch, whether invoked by software (i.e., setting the OSWEN bit after changing the NOSCx bits) or by hardware (i.e., Fail-Safe Clock Monitor)
- When a PWRSAV instruction is executed (i.e., Sleep or Idle mode is entered)
- When the device exits Sleep or Idle mode to resume normal operation
- By a CLRWDT instruction during normal execution

**Note:** The CLRWDT and PWRSAV instructions clear the prescaler and postscaler counts when executed.

### 30.5.2 SLEEP AND IDLE MODES

If the WDT is enabled, it continues to run during Sleep or Idle modes. When the WDT time-out occurs, the device wakes the device and code execution continues from where the PWRSAV instruction was executed. The corresponding SLEEP or IDLE bit (RCON<3,2>) needs to be cleared in software after the device wakes up.

### 30.5.3 ENABLING WDT

The WDT is enabled or disabled by the FWDTEN Configuration bit in the FWDT Configuration register. When the FWDTEN Configuration bit is set, the WDT is always enabled.

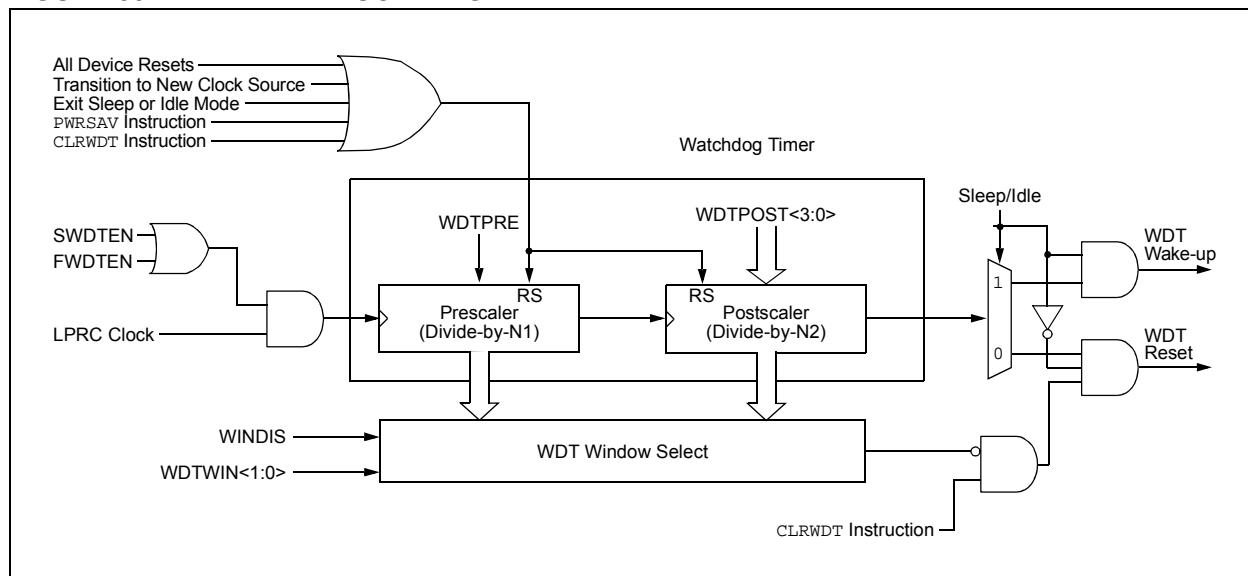

The WDT can be optionally controlled in software when the FWDTEN Configuration bit has been programmed to '0'. The WDT is enabled in software by setting the SWDTEN control bit (RCON<5>). The SWDTEN control bit is cleared on any device Reset. The software WDT option allows the user application to enable the WDT for critical code segments and disable the WDT during non-critical segments for maximum power savings.

The WDT flag bit, WDTO (RCON<4>), is not automatically cleared following a WDT time-out. To detect subsequent WDT events, the flag must be cleared in software.

### 30.5.4 WDT WINDOW

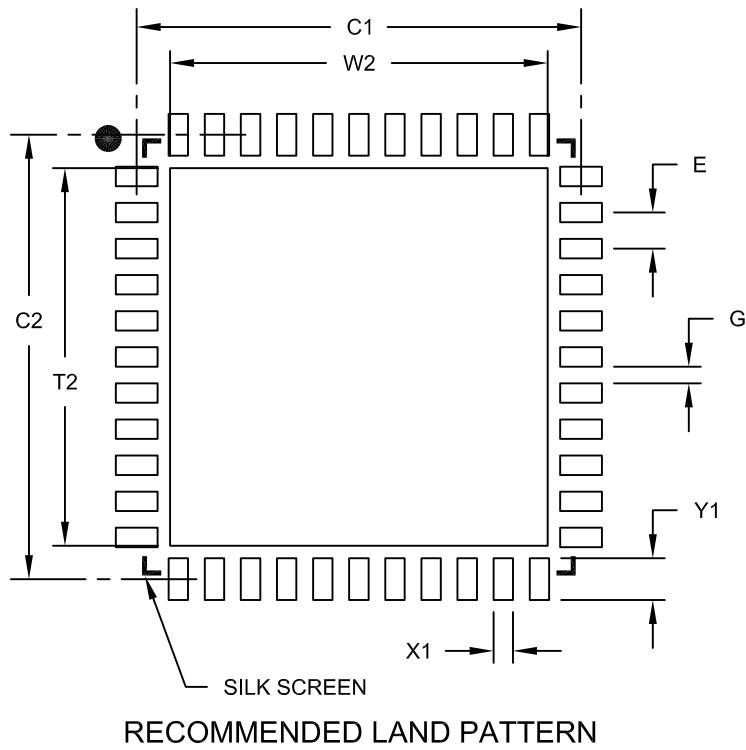

The Watchdog Timer has an optional Windowed mode enabled by programming the WNDIS bit in the WDT Configuration register (FWDT<6>). In the Windowed mode (WNDIS = 0), the WDT should be cleared based on the settings in the programmable Watchdog Timer Window select bits (WDTWIN<1:0>).

**FIGURE 30-2: WDT BLOCK DIAGRAM**

## 44-Lead Plastic Quad Flat, No Lead Package (ML) - 8x8 mm Body [QFN]

**Note:** For the most current package drawings, please see the Microchip Packaging Specification located at <http://www.microchip.com/packaging>

Dimension	Units	MILLIMETERS		
		MIN	NOM	MAX
Contact Pitch	E		0.65	BSC
Optional Center Pad Width	W2			6.60
Optional Center Pad Length	T2			6.60
Contact Pad Spacing	C1		8.00	
Contact Pad Spacing	C2		8.00	
Contact Pad Width (X44)	X1			0.35
Contact Pad Length (X44)	Y1			0.85
Distance Between Pads	G	0.25		

Notes:

1. Dimensioning and tolerancing per ASME Y14.5M

BSC: Basic Dimension. Theoretically exact value shown without tolerances.
