
Welcome to E-XFL.COM

What is "Embedded - Microcontrollers"?

"Embedded - Microcontrollers" refer to small, integrated circuits designed to perform specific tasks within larger systems. These microcontrollers are essentially compact computers on a single chip, containing a processor core, memory, and programmable input/output peripherals. They are called "embedded" because they are embedded within electronic devices to control various functions, rather than serving as standalone computers. Microcontrollers are crucial in modern electronics, providing the intelligence and control needed for a wide range of applications.

Applications of "Embedded - Microcontrollers"

Details	
Product Status	Active
Core Processor	e200z3
Core Size	32-Bit Single-Core
Speed	80MHz
Connectivity	CANbus, EBI/EMI, LINbus, SCI, SPI, UART/USART
Peripherals	DMA, POR, PWM, WDT
Number of I/O	80
Program Memory Size	1.5MB (1.5M x 8)
Program Memory Type	FLASH
EEPROM Size	-
RAM Size	94K x 8
Voltage - Supply (Vcc/Vdd)	1.14V ~ 1.32V
Data Converters	A/D 32x12b
Oscillator Type	Internal
Operating Temperature	-40°C ~ 125°C (TA)
Mounting Type	Surface Mount
Package / Case	144-LQFP
Supplier Device Package	144-LQFP (20x20)
Purchase URL	https://www.e-xfl.com/product-detail/stmicroelectronics/spc563m64l5coar

List of figures

The SPC563Mxx has a single level of memory hierarchy consisting of up to 94 KB on-chip SRAM and up to 1.5 MB of internal Flash memory. The SPC563Mxx also has an external bus interface (EBI) for 'calibration'[(b)].

On-chip modules include:

- Single issue, 32-bit Power Architecture technology compliant e200z335 CPU core complex
  - Includes Variable Length Encoding (VLE) enhancements for code size reduction
  - Floating Point Unit (FPU)
- 32-channel direct memory access controller (DMA)
- Interrupt controller (INTC) capable of handling 364 selectable-priority interrupt sources—191 peripheral interrupt sources, 8 software interrupts and 165 reserved interrupts.
- Frequency-modulated phase-locked loop (FMPLL)
- Calibration external bus interface (EBI)[b]
- System integration unit (SIU)
- Up to 1.5 MB on-chip flash with flash controller
  - Fetch Accelerator for single cycle flash access @80 MHz
- Up to 94 KB on-chip static RAM (including up to 32 KB standby RAM)
- Boot assist module (BAM)
- 32-channel second-generation enhanced time processor unit (eTPU2)
  - 32 standard eTPU channels
  - Architectural enhancements to improve code efficiency and added flexibility
- 16-channels enhanced modular input-output system (eMIOS)
- Enhanced queued analog-to-digital converter (eQADC)
- Decimation filter (part of eQADC)
- Silicon die temperature sensor
- Two deserial serial peripheral interface (DSPI) modules (compatible with Microsecond Channel)
- Two enhanced serial communication interface (eSCI) modules compatible with LIN
- Two Controller Area Network (FlexCAN) modules that support CAN 2.0B
- Nexus port controller (NPC) per IEEE-ISTO 5001-2003 standard
- IEEE 1149.1 (JTAG) support
- Nexus interface
- On-chip voltage regulator controller that provides 1.2 V and 3.3 V internal supplies from a 5 V external source
- Designed for LQFP100, LQFP144, LQFP176, and LBGA208 packages

b. The external bus interface is only accessible when using the calibration tool. It is not available on production packages.

2 Block diagram

Figure 1 shows a top-level block diagram of the SPC563M64.

Figure 1. SPC563Mxx block diagram

  - 9-bit vector
    Unique vector for each interrupt request source
    Provided by hardware connection to processor or read from register
  - Each interrupt source can be programmed to one of 16 priorities
  - Preemption
    Preemptive prioritized interrupt requests to processor
    ISR at a higher priority preempts ISRs or tasks at lower priorities
    Automatic pushing or popping of preempted priority to or from a LIFO
    Ability to modify the ISR or task priority. Modifying the priority can be used to implement the Priority Ceiling Protocol for accessing shared resources.
  - Low latency—three clocks from receipt of interrupt request from peripheral to interrupt request to processor
- Frequency Modulating Phase-locked loop (FMPLL)
  - Reference clock pre-divider (PREDIV) for finer frequency synthesis resolution
  - Reduced frequency divider (RFD) for reducing the FMPLL output clock frequency without forcing the FMPLL to re-lock
  - System clock divider (SYSDIV) for reducing the system clock frequency in normal or bypass mode
  - Input clock frequency range from 4 MHz to 20 MHz before the pre-divider, and from 4 MHz to 16 MHz at the FMPLL input
  - Voltage controlled oscillator (VCO) range from 256 MHz to 512 MHz
  - VCO free-running frequency range from 25 MHz to 125 MHz
  - Four bypass modes: crystal or external reference with PLL on or off
  - Two normal modes: crystal or external reference
  - Programmable frequency modulation
    Triangle wave modulation
    Register programmable modulation frequency and depth
  - Lock detect circuitry reports when the FMPLL has achieved frequency lock and continuously monitors lock status to report loss of lock conditions
    User-selectable ability to generate an interrupt request upon loss of lock
    User-selectable ability to generate a system reset upon loss of lock
  - Clock quality monitor (CQM) module provides loss-of-clock detection for the FMPLL reference and output clocks
    User-selectable ability to generate an interrupt request upon loss of clock
    User-selectable ability to generate a system reset upon loss of clock
    Backup clock (reference clock or FMPLL free-running) can be applied to the system in case of loss of clock
- Calibration bus interface (EBI)
  - Available only in the calibration package (496 CSP package)
  - 1.8 V to 3.3 V ± 10% I/O (1.6 V to 3.6 V)
  - Memory controller with support for various memory types
  - 16-bit data bus, up to 22-bit address bus
  - Selectable drive strength

  - One with 32 message buffers; the second with 64 message buffers
  - Full implementation of the CAN protocol specification, Version 2.0B
  - Programmable acceptance filters
  - Short latency time for high priority transmit messages
  - Arbitration scheme according to message ID or message buffer number
  - Listen only mode capabilities
  - Programmable clock source: system clock or oscillator clock
  - Message buffers may be configured as mailboxes or as FIFO
- Nexus port controller (NPC)
  - Per IEEE-ISTO 5001-2003
  - Real time development support for Power Architecture core and eTPU engine through Nexus class 2/1
  - Read and write access (Nexus class 3 feature that is supported on this device)
    Run-time access of entire memory map
    Calibration
  - Support for data value breakpoints / watchpoints
    Run-time access of entire memory map
    Calibration
    Table constants calibrated using MMU and internal and external RAM
    Scalar constants calibrated using cache line locking
  - Configured via the IEEE 1149.1 (JTAG) port
- IEEE 1149.1 JTAG controller (JTAGC)
  - IEEE 1149.1-2001 Test Access Port (TAP) interface
  - 5-bit instruction register that supports IEEE 1149.1-2001 defined instructions
  - 5-bit instruction register that supports additional public instructions
  - Three test data registers: a bypass register, a boundary scan register, and a device identification register
  - Censorship disable register. By writing the 64-bit serial boot password to this register, Censorship may be disabled until the next reset
  - TAP controller state machine that controls the operation of the data registers, instruction register and associated circuitry
- On-chip Voltage Regulator for single 5 V supply operation
  - On-chip regulator 5 V to 3.3 V for internal supplies
  - On-chip regulator controller 5 V to 1.2 V (with external bypass transistor) for core logic
- Low-power modes
  - SLOW Mode. Allows device to be run at very low speed (approximately 1 MHz), with modules (including the PLL) selectively disabled in software
  - STOP Mode. System clock stopped to all modules including the CPU. Wake-up timer used to restart the system clock after a predetermined time

3.3 Feature details

3.3.1 e200z335 core

The e200z335 processor utilizes a four stage pipeline for instruction execution. The Instruction Fetch (stage 1), Instruction Decode/Register file Read/Effective Address Calculation (stage 2), Execute/Memory Access (stage 3), and Register Writeback (stage 4) stages operate in an overlapped fashion, allowing single clock instruction execution for most instructions.

The integer execution unit consists of a 32-bit Arithmetic Unit (AU), a Logic Unit (LU), a 32-bit Barrel shifter (Shifter), a Mask-Insertion Unit (MIU), a Condition Register manipulation Unit (CRU), a Count-Leading-Zeros unit (CLZ), a 32×32 Hardware Multiplier array, result feed-forward hardware, and support hardware for division.

Most arithmetic and logical operations are executed in a single cycle with the exception of the divide instructions. A Count-Leading-Zeros unit operates in a single clock cycle. The Instruction Unit contains a PC incrementer and a dedicated Branch Address adder to minimize delays during change of flow operations. Sequential prefetching is performed to ensure a supply of instructions into the execution pipeline. Branch target prefetching is performed to accelerate taken branches. Prefetched instructions are placed into an instruction buffer capable of holding six instructions.

Branches can also be decoded at the instruction buffer and branch target addresses calculated prior to the branch reaching the instruction decode stage, allowing the branch target to be prefetched early. When a branch is detected at the instruction buffer, a prediction may be made on whether the branch is taken or not. If the branch is predicted to be taken, a target fetch is initiated and its target instructions are placed in the instruction buffer following the branch instruction. Many branches take zero cycle to execute by using branch folding. Branches are folded out from the instruction execution pipe whenever possible. These include unconditional branches and conditional branches with condition codes that can be resolved early.

Conditional branches which are not taken and not folded execute in a single clock. Branches with successful target prefetching which are not folded have an effective execution time of one clock. All other taken branches have an execution time of two clocks. Memory load and store operations are provided for byte, halfword, and word (32-bit) data with automatic zero or sign extension of byte and halfword load data as well as optional byte reversal of data. These instructions can be pipelined to allow effective single cycle throughput. Load and store multiple word instructions allow low overhead context save and restore operations. The load/store unit contains a dedicated effective address adder to allow effective address generation to be optimized. Also, a load-to-use dependency does not incur any pipeline bubbles for most cases.

The Condition Register unit supports the condition register (CR) and condition register operations defined by the Power Architecture. The condition register consists of eight 4-bit fields that reflect the results of certain operations, such as move, integer and floating-point compare, arithmetic, and logical instructions, and provide a mechanism for testing and branching. Vectored and autovectored interrupts are supported by the CPU. Vectored interrupt support is provided to allow multiple interrupt sources to have unique interrupt handlers invoked with no software overhead.

The hardware floating-point unit utilizes the IEEE-754 single-precision floating-point format and supports single-precision floating-point operations in a pipelined fashion. The general purpose register file is used for source and destination operands, thus there is a unified

based upon the ID of the last master to be granted access. The crossbar provides the following features:

- 3 master ports:
  - e200z335 core complex Instruction port
  - e200z335 core complex Load/Store port
  - eDMA
- 4 slave ports
  - FLASH
  - calibration bus
  - SRAM
  - Peripheral bridge A/B (eTPU2, eMIOS, SIU, DSPI, eSCI, FlexCAN, eQADC, BAM, decimation filter, PIT, STM and SWT)
- 32-bit internal address, 64-bit internal data paths

3.3.3 eDMA

The enhanced direct memory access (eDMA) controller is a second-generation module capable of performing complex data movements via 32 programmable channels, with minimal intervention from the host processor. The hardware micro architecture includes a DMA engine which performs source and destination address calculations, and the actual data movement operations, along with an SRAM-based memory containing the transfer control descriptors (TCD) for the channels. This implementation is utilized to minimize the overall block size. The eDMA module provides the following features:

- All data movement via dual-address transfers: read from source, write to destination
- Programmable source and destination addresses, transfer size, plus support for enhanced addressing modes
- Transfer control descriptor organized to support two-deep, nested transfer operations
- An inner data transfer loop defined by a “minor” byte transfer count
- An outer data transfer loop defined by a “major” iteration count
- Channel activation via one of three methods:
  - Explicit software initiation
  - Initiation via a channel-to-channel linking mechanism for continuous transfers
  - Peripheral-paced hardware requests (one per channel)
- Support for fixed-priority and round-robin channel arbitration
- Channel completion reported via optional interrupt requests
- 1 interrupt per channel, optionally asserted at completion of major iteration count
- Error termination interrupts are optionally enabled
- Support for scatter/gather DMA processing
- Channel transfers can be suspended by a higher priority channel

3.3.4 Interrupt controller

The INTC (interrupt controller) provides priority-based preemptive scheduling of interrupt requests, suitable for statically scheduled hard real-time systems. The INTC allows interrupt request servicing from up to 191 peripheral interrupt request sources, plus 165 sources reserved for compatibility with other family members).

For high priority interrupt requests, the time from the assertion of the interrupt request from the peripheral to when the processor is executing the interrupt service routine (ISR) has been minimized. The INTC provides a unique vector for each interrupt request source for quick determination of which ISR needs to be executed. It also provides an ample number of priorities so that lower priority ISRs do not delay the execution of higher priority ISRs. To allow the appropriate priorities for each source of interrupt request, the priority of each interrupt request is software configurable.

When multiple tasks share a resource, coherent accesses to that resource need to be supported. The INTC supports the priority ceiling protocol for coherent accesses. By providing a modifiable priority mask, the priority can be raised temporarily so that all tasks which share the resource can not preempt each other.

Multiple processors can assert interrupt requests to each other through software setable interrupt requests. These same software setable interrupt requests also can be used to break the work involved in servicing an interrupt request into a high priority portion and a low priority portion. The high priority portion is initiated by a peripheral interrupt request, but then the ISR asserts a software setable interrupt request to finish the servicing in a lower priority ISR. Therefore these software setable interrupt requests can be used instead of the peripheral ISR scheduling a task through the RTOS.

The INTC provides the following features:

- 356 peripheral interrupt request sources
- 8 software setable interrupt request sources
- 9-bit vector addresses
- Unique vector for each interrupt request source
- Hardware connection to processor or read from register
- Each interrupt source can be programmed to one of 16 priorities
- Preemptive prioritized interrupt requests to processor
- ISR at a higher priority preempts executing ISRs or tasks at lower priorities
- Automatic pushing or popping of preempted priority to or from a LIFO
- Ability to modify the ISR or task priority to implement the priority ceiling protocol for accessing shared resources
- Low latency—three clocks from receipt of interrupt request from peripheral to interrupt request to processor

This device also includes a non-maskable interrupt (NMI) pin that bypasses the INTC and multiplexing logic.

3.3.5 FMPLL

The FMPLL allows the user to generate high speed system clocks from a 4 MHz to 20 MHz crystal oscillator or external clock generator. Further, the FMPLL supports programmable frequency modulation of the system clock. The PLL multiplication factor, output clock divider ratio are all software configurable.

The PLL has the following major features:

- Input clock frequency from 4 MHz to 20 MHz
- Voltage controlled oscillator (VCO) range from 256 MHz to 512 MHz, resulting in system clock frequencies from 16 MHz to 80 MHz with granularity of 4 MHz or better
- Reduced frequency divider (RFD) for reduced frequency operation without forcing the PLL to relock
- 3 modes of operation
  - Bypass mode with PLL off
  - Bypass mode with PLL running (default mode out of reset)
  - PLL normal mode
- Each of the three modes may be run with a crystal oscillator or an external clock reference
- Programmable frequency modulation
  - Modulation enabled/disabled through software
  - Triangle wave modulation up to 100 kHz modulation frequency
  - Programmable modulation depth (0% to 2% modulation depth)
  - Programmable modulation frequency dependent on reference frequency
- Lock detect circuitry reports when the PLL has achieved frequency lock and continuously monitors lock status to report loss of lock conditions
- Clock Quality Module
  - detects the quality of the crystal clock and cause interrupt request or system reset if error is detected
  - detects the quality of the PLL output clock. If an error is detected, causes a system reset or switches the system clock to the crystal clock and causes an interrupt request
- Programmable interrupt request or system reset on loss of lock

3.3.6 Calibration EBI

The Calibration EBI controls data transfer across the crossbar switch to/from memories or peripherals attached to the calibration tool connector in the calibration address space. The Calibration EBI is only available in the calibration tool. The Calibration EBI includes a memory controller that generates interface signals to support a variety of external memories. The Calibration EBI memory controller supports legacy flash, SRAM, and asynchronous memories. In addition, the calibration EBI supports up to three regions via chip selects (two chip selects are multiplexed with two address bits), along with programmed region-specific attributes. The calibration EBI supports the following features:

- 22-bit address bus (two most significant signals multiplexed with two chip selects)
- 16-bit data bus
- Multiplexed mode with addresses and data signals present on the data lines

Note: The calibration EBI must be configured in multiplexed mode when the extended Nexus trace is used on the VertiCal Calibration Systemcalibration tool. This is because Nexus signals and address lines of the calibration bus share the same balls in the calibration package.

- Memory controller with support for various memory types:
  - Asynchronous/legacy flash and SRAM
- Bus monitor
  - User selectable
  - Programmable time-out period (with 8 external bus clock resolution)
- Configurable wait states (via chip selects)
- 3 chip-select (Cal_$\overline{CS}$[0], Cal_$\overline{CS}$[2:3]) signals (Multiplexed with 2 most significant address signals)
- 2 write/byte enable (WE[0:1]/BE[0:1]) signals
- Configurable bus speed modes
  - system frequency
  - 1/2 of system frequency
  - 1/4 of system frequency
- Optional automatic CLKOUT gating to save power and reduce EMI
- Selectable drive strengths; 10 pF, 20 pF, 30 pF, 50 pF

3.3.7 SIU

The SPC563Mxx SIU controls MCU reset configuration, pad configuration, external interrupt, general purpose I/O (GPIO), internal peripheral multiplexing, and the system reset operation. The reset configuration block contains the external pin boot configuration logic. The pad configuration block controls the static electrical characteristics of I/O pins. The GPIO block provides uniform and discrete input/output control of the I/O pins of the MCU. The reset controller performs reset monitoring of internal and external reset sources, and

The eMIOS provides the following features:

- 16 channels (24-bit timer resolution)
- For compatibility with other family members selected channels and timebases are implemented:
  - Channels 0 to 6, 8 to 15, and 23
  - Timebases A, B and C
- Channels 1, 3, 5 and 6 support modes:
  - General Purpose Input/Output (GPIO)
  - Single Action Input Capture (SAIC)
  - Single Action Output Compare (SAOC)
- Channels 2, 4, 11 and 13 support all the modes above plus:
  - Output Pulse Width Modulation Buffered (OPWMB)
- Channels 0, 8, 9, 10, 12, 14, 15, 23 support all the modes above plus:
  - Input Period Measurement (IPM)
  - Input Pulse Width Measurement (IPWM)
  - Double Action Output Compare (set flag on both matches) (DAOC)
  - Modulus Counter Buffered (MCB)
  - Output Pulse Width and Frequency Modulation Buffered (OPWFMB)
- Three 24-bit wide counter buses
  - Counter bus A can be driven by channel 23 or by the eTPU2 and all channels can use it as a reference
  - Counter bus B is driven by channel 0 and channels 0 to 6 can use it as a reference
  - Counter bus C is driven by channel 8 and channels 8 to 15 can use it as a reference
- Shared time bases with the eTPU2 through the counter buses
- Synchronization among internal and external time bases

3.3.13 eTPU2

The eTPU2 is an enhanced co-processor designed for timing control. Operating in parallel with the host CPU, eTPU2 processes instructions and real-time input events, performs output waveform generation, and accesses shared data without host intervention. Consequently, for each timer event, the host CPU setup and service times are minimized or eliminated. A powerful timer subsystem is formed by combining the eTPU2 with its own instruction and data RAM. High level assembler/compiler and documentation allows customers to develop their own functions on the eTPU2.

The eTPU2 includes these distinctive features:

- The Timer Counter (TCR1), channel logic and digital filters (both channel and the external timer clock input [TCRCLK]) now have an option to run at full system clock speed or system clock / 2.
- Channels support unordered transitions: transition 2 can now be detected before transition 1. Related to this enhancement, the transition detection latches (TDL1 and TDL2) can now be independently negated by microcode.
- A new User Programmable Channel Mode has been added: the blocking, enabling, service request and capture characteristics of this channel mode can be programmed via microcode.
- Microinstructions now provide an option to issue Interrupt and Data Transfer requests selected by channel. They can also be requested simultaneously at the same instruction.
- Channel Flags 0 and 1 can now be tested for branching, in addition to selecting the entry point.
- Channel digital filters can be bypassed.
- The Timer Counter (TCR1), channel logic and digital filters (both channel and the external timer clock input [TCRCLK]) now have an option to run at full system clock speed or system clock / 2.
- Channels support unordered transitions: transition 2 can now be detected before transition 1. Related to this enhancement, the transition detection latches (TDL1 and TDL2) can now be independently negated by microcode.
- A new User Programmable Channel Mode has been added: the blocking, enabling, service request and capture characteristics of this channel mode can be programmed via microcode.
- Microinstructions now provide an option to issue Interrupt and Data Transfer requests selected by channel. They can also be requested simultaneously at the same instruction.
- Channel Flags 0 and 1 can now be tested for branching, in addition to selecting the entry point.
- Channel digital filters can be bypassed.
- 32 channels, each channel is associated with one input and one output signal
  - Enhanced input digital filters on the input pins for improved noise immunity.
  - Identical, orthogonal channels: each channel can perform any time function. Each time function can be assigned to more than one channel at a given time, so each signal can have any functionality.
  - Each channel has an event mechanism which supports single and double action functionality in various combinations. It includes two 24-bit capture registers, two 24-bit match registers, 24-bit greater-equal and equal-only comparators
  - Input and output signal states visible from the host
- 2 independent 24-bit time bases for channel synchronization:
  - First time base clocked by system clock with programmable prescale division from 2 to 512 (in steps of 2), or by output of second time base prescaler
  - Second time base counter can work as a continuous angle counter, enabling angle based applications to match angle instead of time
  - Both time bases can be exported to the eMIOS timer module
  - Both time bases visible from the host

The eQADC prioritizes and transfers commands from six command conversion command ‘queues’ to the on-chip ADCs or to the external device. The block can also receive data from the on-chip ADCs or from an off-chip external device into the six result queues, in parallel, independently of the command queues. The six command queues are prioritized with Queue_0 having the highest priority and Queue_5 the lowest. Queue_0 also has the added ability to bypass all buffering and queuing and abort a currently running conversion on either ADC and start a Queue_0 conversion. This means that Queue_0 will always have a deterministic time from trigger to start of conversion, irrespective of what tasks the ADCs were performing when the trigger occurred. The eQADC supports software and external hardware triggers from other blocks to initiate transfers of commands from the queues to the on-chip ADCs or to the external device. It also monitors the fullness of command queues and result queues, and accordingly generates DMA or interrupt requests to control data movement between the queues and the system memory, which is external to the eQADC.

The ADCs also support features designed to allow the direct connection of high impedance acoustic sensors that might be used in a system for detecting engine knock. These features include differential inputs; integrated variable gain amplifiers for increasing the dynamic range; programmable pull-up and pull-down resistors for biasing and sensor diagnostics.

The eQADC also integrates a programmable decimation filter capable of taking in ADC conversion results at a high rate, passing them through a hardware low pass filter, then down-sampling the output of the filter and feeding the lower sample rate results to the result FIFOs. This allows the ADCs to sample the sensor at a rate high enough to avoid aliasing of out-of-band noise; while providing a reduced sample rate output to minimize the amount DSP processing bandwidth required to fully process the digitized waveform.

The eQADC provides the following features:

- Dual on-chip ADCs
  - 2 × 12-bit ADC resolution
  - Programmable resolution for increased conversion speed (12 bit, 10 bit, 8 bit)
    12-bit conversion time – 1 µs (1M sample/sec)
    10-bit conversion time – 867 ns (1.2M sample/second)
    8-bit conversion time – 733 ns (1.4M sample/second)
  - Up to 10-bit accuracy at 500 KSample/s and 9-bit accuracy at 1 MSample/s
  - Differential conversions
  - Single-ended signal range from 0 to 5 V
  - Variable gain amplifiers on differential inputs (×1, ×2, ×4)
  - Sample times of 2 (default), 8, 64 or 128 ADC clock cycles
  - Provides time stamp information when requested
  - Parallel interface to eQADC CFIFOs and RFIFOs
  - Supports both right-justified unsigned and signed formats for conversion results
- Up to 34[(e)] input channels (accessible by both ADCs)
- 23 additional internal channels for measuring control and monitoring voltages inside the device
  - Including Core voltage, I/O voltage, LVI voltages, etc.
- An internal bandgap reference to allow absolute voltage measurements
- 4 pairs of differential analog input channels
  - Programmable pull-up/pull-down resistors on each differential input for biasing and sensor diagnostic (200 kΩ, 100 kΩ, 5 kΩ)
- Silicon die temperature sensor
  - provides temperature of silicon as an analog value
  - read using an internal ADC analog channel
  - may be read with either ADC
- Decimation filter
  - Programmable decimation factor (2 to 16)
  - Selectable IIR or FIR filter
  - Up to 4th order IIR or 8th order FIR
  - Programmable coefficients
  - Saturated or non-saturated modes
  - Programmable rounding (convergent; two's complement; truncated)
  - Pre-fill mode to pre-condition the filter before the sample window opens
- Full duplex synchronous serial interface to an external device
  - Free-running clock for use by an external device
  - Supports a 26-bit message length
- Priority based Queues
  - Supports six Queues with fixed priority. When commands of distinct Queues are

e. 176-pin and 208-pin packages have 34 input channels; 144-pin package has 32; 100-pin package has 23.

interface to Local Interconnect Network (LIN) slave devices. The eSCI block provides the following features:

- Full-duplex operation
- Standard mark/space non-return-to-zero (NRZ) format
- 13-bit baud rate selection
- Programmable 8-bit or 9-bit, data format
- Programmable 12-bit or 13-bit data format for Timed Serial Bus (TSB) configuration to support the Microsecond Channel upstream
- Automatic parity generation
- LIN support
  - Autonomous transmission of entire frames
  - Configurable to support all revisions of the LIN standard
  - Automatic parity bit generation
  - Double stop bit after bit error
  - 10- or 13-bit break support
  - Separately enabled transmitter and receiver
  - Programmable transmitter output parity
  - 2 receiver wake up methods:
    Idle line wake-up
    Address mark wake-up
- Interrupt-driven operation with flags
- Receiver framing error detection
- Hardware parity checking
- 1/16 bit-time noise detection
- DMA support for both transmit and receive data
  - Global error bit stored with receive data in system RAM to allow post processing of errors

3.3.17 FlexCAN

The SPC563Mxx MCU contains two controller area network (FlexCAN) blocks. The FlexCAN module is a communication controller implementing the CAN protocol according to Bosch Specification version 2.0B. The CAN protocol was designed to be used primarily as a vehicle serial data bus, meeting the specific requirements of this field: real-time processing, reliable operation in the EMI environment of a vehicle, cost-effectiveness and required bandwidth. FlexCAN module ‘A’ contains 64 message buffers (MB); FlexCAN module ‘C’ contains 32 message buffers.

The following features are implemented:

- 5-pin JTAG port (JCOMP, TDI, TDO, TMS, and TCK)
  - Always available in production package
  - Supports both JTAG Boundary Scan and debug modes
  - 3.3 V interface
  - Supports Nexus class 1 features
  - Supports Nexus class 3 read/write feature
- 9-pin Reduced Port interface in LQFP144 production package
  - Alternate function as IO
  - 5 V (in GPIO or alternate function mode), 3.3 V (in Nexus mode) interface
  - Auxiliary Output port

    1 MCKO (message clock out) pin

    4 MDO (message data out) pins

    2 $\overline{\text{MSEO}}$ (message start/end out) pins

    1 $\overline{\text{EVTO}}$ (event out) pin
  - Auxiliary input port

    1 $\overline{\text{EVTI}}$ (event in) pin
- 17-pin Full Port interface in calibration package used on calibration tool boards
  - 3.3 V interface
  - Auxiliary Output port

    1 MCKO (message clock out) pin

    4 (reduced port mode) or 12 (full port mode) MDO (message data out) pins; 8 extra full port pins shared with calibration bus

    2 $\overline{\text{MSEO}}$ (message start/end out) pins

    1 $\overline{\text{EVTO}}$ (event out) pin
  - Auxiliary input port

    1 $\overline{\text{EVTI}}$ (event in) pin
- Host processor (e200) development support features
  - IEEE-ISTO 5001-2003 standard class 2 compliant
  - Program trace via branch trace messaging (BTM). Branch trace messaging displays program flow discontinuities (direct branches, indirect branches, exceptions, etc.), allowing the development tool to interpolate what transpires between the discontinuities. Thus, static code may be traced.
  - Watchpoint trigger enable of program trace messaging
  - Data Value Breakpoints (JTAG feature of the e200z335 core): allows CPU to be halted when the CPU writes a specific value to a memory location

    4 data value breakpoints

    CPU only

    Detects ‘equal’ and ‘not equal’

    Byte, half word, word (naturally aligned)

4 Orderable parts

Table 3. Order codes

Order code	Flash/SRAM (Kbytes)	Package	Speed (MHz)
SPC563M60L5CPBR	1024 / 64	LQFP144 Pb-free	64
SPC563M60L5CPBY			
SPC563M60L5CPAR	1024 / 64	LQFP144 Pb-free	80
SPC563M60L5CPAY			
SPC563M60L7CPBR	1024 / 64	LQFP176 Pb-free	64
SPC563M60L7CPBY			
SPC563M60L7CPAR	1024 / 64	LQFP176 Pb-free	80
SPC563M60L7CPAY			
SPC563M64L5COBR	1536 / 94	LQFP144 Pb-free	64
SPC563M64L5COBY			
SPC563M64L5COAR	1536 / 94	LQFP144 Pb-free	80
SPC563M64L5COAY			
SPC563M64L7COBR	1536 / 94	LQFP176 Pb-free	64
SPC563M64L7COBY			
SPC563M64L7COAR	1536 / 94	LQFP176 Pb-free	80
SPC563M64L7COAY			

5 Revision history

Table 4. Revision history

Date	Revision	Description
30-Aug-2007	1	Initial release.
7-Nov-2007	2	Removed: – - Section 5: LQFP144 pinout diagram including Figure 2: LQFP144 pinout – - Section 6: LQFP144 pin description including Table 3: LQFP144 pin description – - Section 7: LFBGA208 ballout diagram including Figure 3: LFBGA208 ballout Added – - Section 5: Signal description on page 43 including Section 5.1: Signal properties summary, Table 3: SPC563M60 signal properties, Section 5.2: Detailed signal descriptions, Section 5.3: I/O power/ground segmentation and Table 4: SPC563M60 power/ground segmentation – - Section 6: Device pin outs on page 69 including Section 6.1: LQFP144 pinout, Figure 2: LQFP144 pinout, Section 6.2: LFBGA208 ballout diagram and Figure 3: LFBGA208 ballout diagram Removed parameters D3 and E3 from Figure 4: LQFP144 (20 x 20 x 1.40 mm) package mechanical outline: Removed minimum and maximum values for parameters D, D1, E and E1 and removed parameters D3 and E3 from Table 6: LQFP144 package mechanical data on page 74: Added note about LQFP144 package and JEDEC compliancy to Section 8: Package information on page 73
13-Mar-2009	3	Updated document to include information on all members of the SPC563Mxx family. Replaced references to the core (was “e200z3”, is “e200z335”) and Nexus module (was “Nexus development interface (NDI)”, is “Nexus port controller (NPC)”). Changed the arrangement of V_{STBY}, the standby RAM, and the voltage regulator in the block diagram. Revised the device-comparison table and feature list. In the “Feature List” section, added “(for 100- and 144-pin packages)” to the “Single power supply” operating parameter. In the “Feature Details” section, replaced the CI/NMI text in the INTC description with information on the NMI only. Reformatted company-specific references. Added a revision history. Formatting, spelling, grammar, and layout corrections.

Table 4. Revision history

Date	Revision	Description
18-May-2011	4	Internal review. Block diagram updated: – Test Controller removed. Device Summary (device comparison) table updated: – The SPC563M64 will not be offered in an LQFP100 package. – Footnote added clarifying the number of eQADC channels. Feature list: – “Single power supply” applies to all packages. (previously stated 100- and 144-pin packages) – “Nexus pins powered by 3.3 V supply” applies to all packages. (previously stated LBGA208 and LQFP176 packages) – Calibration pin voltages deleted – Details added to eTPU and eQADC features – eMIOS features updated – eTPU renamed to ETPU2; features updated Orderable parts table updated

Table 4. Revision history

Date	Revision	Description
08-Jun-2011	5	Replaced in all document "... Architecture Book E compliant..." with "... Architecture technology compliant..." Updated "Introduction": Added "Document overview" and "Description" sections. Made the following changes in the "Description" section: – Added "Floating Point Unit (FPU)" bullet under "Single issue, 32-bit Power Architecture technology compliant e200z335 CPU core complex". – Changed "eTPU" to "eTPU2" in the "32-channel second-generation enhanced time processor unit" sentence. – Changed the "Available in LQFP100, LQFP144, LQFP176 and LBGA208" sentence to "Designed for LQFP100, LQFP144, LQFP176, and LBGA208 packages". Replaced all instances of "Microsecond Bus" with "Microsecond Channel". Replaced all instances of "SPC563M54" and "SPC563M60" with "SPC563M54P"and "SPC563M60P", respectively. Changed the "Standby SRAM size" of the SPC563M60P device from "24" to "32". Replaced all instances of "downlink" with "downstream" and "uplink" with "upstream". Made the following changes in the "Flash" section: Changed "Program page size of 128 bits (four words) to accelerate programming" to "Program page size of 64 bits (two words)". Changed "Erase suspend, program suspend and erase-suspended program" to "Erase suspend". Made editorial changes in the "BAM" section: Updated the conditional tags in the "Supports serial bootloading..." sentences. Changed "Shared time bases with the eTPU through the counter buses" to "Shared time bases with the eTPU2 through the counter buses" in the "eMIOS" section. Removed the following sentences from the "eTPU2" section: "For Monaco 1.5M, the eTPU2 has been further enhanced with these features:" "Timebases and channels are run at full system clock speed" "Programmable channel mode allows customization of channel function" "More flexibility in requesting DMA and interrupt service" "Channel flags can be tested" Added the following sentence in the "eQADC" section under the "Priority based Queues" bullet: "Streaming mode operation of Queue_0 to execute some commands several times". Changed the following sentences in the "DSPI" section: "The DSPI can be configured ... that implements ... the Microsecond Bus protocol" to "The DSPI can be configured ... that supports ... the Microsecond Channel protocol". "The DSPI pins support 5 V logic levels or Low Voltage Differential Signalling (LVDS) to improve high speed operation." to "The DSPI ouput pins support 5 V logic levels or Low Voltage Differential Signalling (LVDS) according to the Microsecond Channel specification."
