
Welcome to E-XFL.COM

Understanding Embedded - Microprocessors

Embedded microprocessors are specialized computing chips designed to perform specific tasks within an embedded system. Unlike general-purpose microprocessors found in personal computers, embedded microprocessors are tailored for dedicated functions within larger systems, offering optimized performance, efficiency, and reliability. These microprocessors are integral to the operation of countless electronic devices, providing the computational power necessary for controlling processes, handling data, and managing communications.

Applications of Embedded - Microprocessors

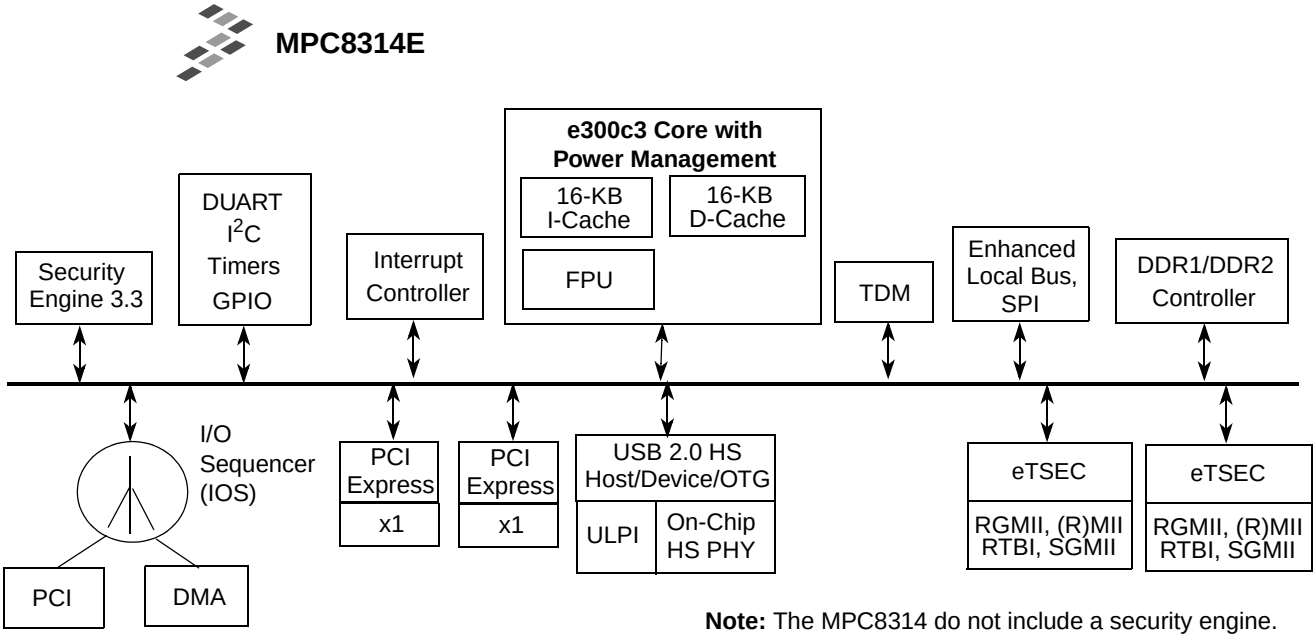
Embedded microprocessors are utilized across a broad spectrum of applications, making them indispensable in

Details	
Product Status	Obsolete
Core Processor	PowerPC e300c3
Number of Cores/Bus Width	1 Core, 32-Bit
Speed	400MHz
Co-Processors/DSP	-
RAM Controllers	DDR, DDR2
Graphics Acceleration	No
Display & Interface Controllers	-
Ethernet	10/100/1000Mbps (2)
SATA	-
USB	USB 2.0 + PHY (1)
Voltage - I/O	1.8V, 2.5V, 3.3V
Operating Temperature	0°C ~ 105°C (TA)
Security Features	-
Package / Case	620-BBGA Exposed Pad
Supplier Device Package	620-HBGA (29x29)
Purchase URL	https://www.e-xfl.com/product-detail/nxp-semiconductors/kmpc8314vragda

1 Overview

The MPC8314E incorporates the e300c3 (MPC603e-based) core, which includes 16 Kbytes of L1 instruction and data caches, on-chip memory management units (MMUs), and floating-point support. In addition to the e300 core, the SoC platform includes features such as dual enhanced three-speed 10, 100, 1000 Mbps Ethernet controllers (eTSECs) with SGMII support, a 32- or 16-bit DDR1/DDR2 SDRAM memory controller, a security engine to accelerate control and data plane security protocols, and a high degree of software compatibility with previous-generation PowerQUICC processor-based designs for backward compatibility and easier software migration. The MPC8314E also offers peripheral interfaces such as a 32-bit PCI interface with up to 66 MHz operation, 16-bit enhanced local bus interface with up to 66 MHz operation, TDM interface, and USB 2.0 with an on-chip USB 2.0 PHY.

8314E offers additional high-speed interconnect support with dual single-lane PCI Express interfaces. When not used for PCI Express, the SerDes interface may be configured to support SGMII. The MPC8314E security engine (SEC 3.3) allows CPU-intensive cryptographic operations to be offloaded from the main CPU core. This figure shows a block diagram of the MPC8314E.



Note: The MPC8314 do not include a security engine.

Figure 1. MPC8314E Block Diagram

2 MPC8314E Features

The following features are supported in the MPC8314E.

2.1 e300 Core

The e300 core has the following features:

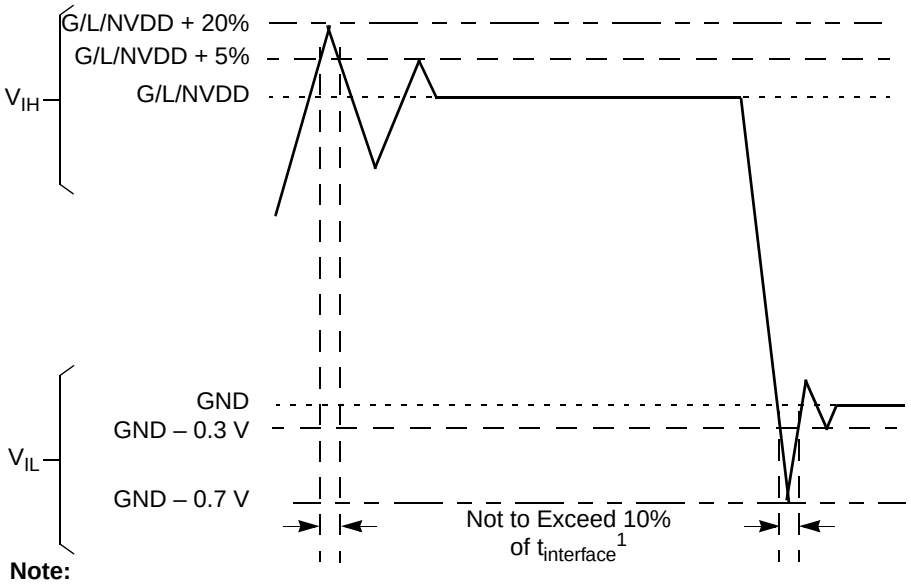
- Operates at up to 400 MHz
- 16-Kbyte instruction cache, 16-Kbyte data cache

Table 2. Recommended Operating Conditions (continued)

Characteristic	Symbol	Recommended Value[1]	Unit	Status in D3 Warm mode	Note

Note:
1. The NVDDx_ON are static power supplies and can be connected together.
2. The NVDDx_OFF are switchable power supplies and can be connected together.
3. Minimum Temperature is specified with T_A;maximum temperature is specified with T_J.
4. All Power rails must be connected and power applied to the MPC8314 even if the IP interfaces are not used.
5. All I/O pins should be interfaced with peripherals operating at same voltage level.
6. This voltage is the input to the filter discussed in Section 25.2, "PLL Power Supply Filtering" and not necessarily the voltage at the AVDD pin.
7. All 1V power supplies should be derived from the same source.

This figure shows the undershoot and overshoot voltages at the interfaces of the MPC8314E.



Note:
1. $t_{interface}$ refers to the clock period associated with the bus clock interface.

Figure 2. Overshoot/Undershoot Voltage for GVDD/NVDD/LVDD

3.1.3 Output Driver Characteristics

This table provides information on the characteristics of the output driver strengths. The values are preliminary estimates.

Table 3. Output Drive Capability

Driver Type	Output Impedance (Ω)	Supply Voltage
Local bus interface utilities signals	42	NVDD = 3.3 V
PCI signals	25	
DDR signal[1]	18	GVDD = 2.5 V
DDR2 signal 1	18	GVDD = 1.8 V

This table provides the DDR2 capacitance when GVDD(typ) = 1.8 V.

Table 12. DDR2 SDRAM Capacitance for GVDD(typ) = 1.8 V

Parameter/Condition	Symbol	Min	Max	Unit	Note
Input/output capacitance: DQ, DQS	C_{IO}	6	8	pF	1
Delta input/output capacitance: DQ, DQS	C_{DIO}	—	0.5	pF	1

Note:
1. This parameter is sampled. GVDD = 1.8 V ± 0.090 V, f = 1 MHz, T_A = 25°C, V_{OUT} = GVDD/2, V_{OUT} (peak-to-peak) = 0.2 V.

This table provides the recommended operating conditions for the DDR SDRAM component(s) of the MPC8314E when GVDD(typ) = 2.5 V.

Table 13. DDR SDRAM DC Electrical Characteristics for GVDD(typ) = 2.5 V

Parameter/Condition	Symbol	Min	Max	Unit	Note
I/O supply voltage	GVDD	2.3	2.7	V	1
I/O reference voltage	MVREF	0.49 × GVDD	0.51 × GVDD	V	2
I/O termination voltage	V_{TT}	MVREF – 0.04	MVREF + 0.04	V	3
Input high voltage	V_{IH}	MVREF + 0.15	GVDD + 0.3	V	—
Input low voltage	V_{IL}	–0.3	MVREF – 0.15	V	—
Output leakage current	I_{OZ}	–9.9	–9.9	μA	4
Output high current (V_{OUT} = 1.95 V, GVDD = 2.3V)	I_{OH}	–16.2	—	mA	—
Output low current (V_{OUT} = 0.35 V)	I_{OL}	16.2	—	mA	—

Note:
1. GVDD is expected to be within 50 mV of the DRAM GVDD at all times.
2. MVREF is expected to be equal to 0.5 × GVDD, and to track GVDD DC variations as measured at the receiver. Peak-to-peak noise on MVREF may not exceed ±2% of the DC value.
3. V_{TT} is not applied directly to the device. It is the supply to which far end signal termination is made and is expected to be equal to MVREF. This rail should track variations in the DC level of MVREF.
4. Output leakage is measured with all outputs disabled, 0 V ≤ V_{OUT} ≤ GVDD.

This table provides the DDR capacitance when GVDD(typ) = 2.5 V.

Table 14. DDR SDRAM Capacitance for GVDD(typ) = 2.5 V Interface

Parameter/Condition	Symbol	Min	Max	Unit	Note
Input/output capacitance: DQ,DQS	C_{IO}	6	8	pF	1
Delta input/output capacitance: DQ, DQS	C_{DIO}	—	0.5	pF	1

Note:
1. This parameter is sampled. GVDD = 2.5 V ± 0.125 V, f = 1 MHz, T_A = 25°C, V_{OUT} = GVDD/2, V_{OUT} (peak-to-peak) = 0.2 V.

This table provides the current draw characteristics for MV_{REF}.

Table 15. Current Draw Characteristics for MV_{REF}

Parameter / Condition	Symbol	Min	Max	Unit	Note
Current draw for MV_{REF}	I_{MVREF}	—	500	μA	1

This figure shows the DDR SDRAM output timing for the MCK to MDQS skew measurement (t_{DDKHMH}).

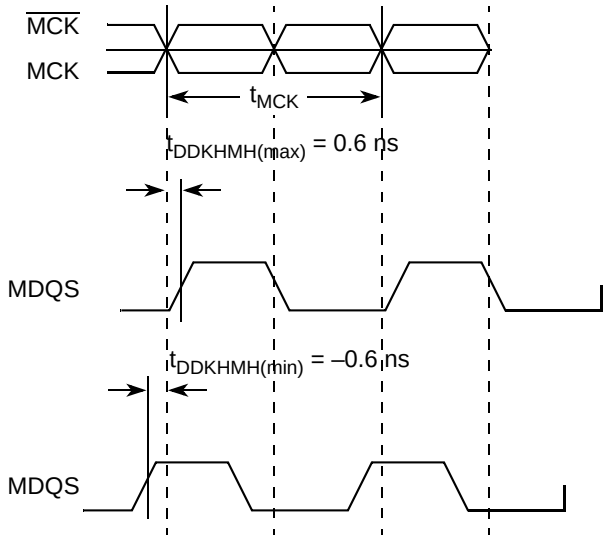


Figure 6. Timing Diagram for t_{DDKHMH}

This figure shows the DDR and DDR2 SDRAM output timing diagram.

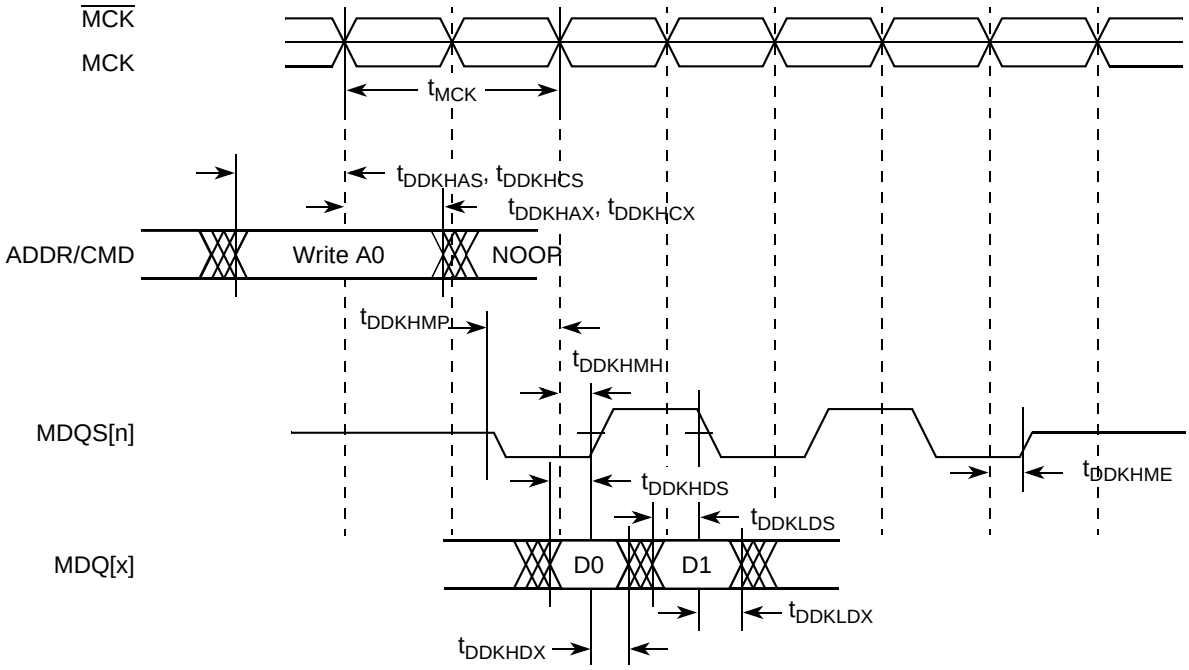

Figure 7. DDR and DDR2 SDRAM Output Timing Diagram

Table 24. RGMII/RTBI (When Operating at 2.5 V) DC Electrical Characteristics (continued)

Parameters	Symbol	Conditions	Min	Max	Unit

Note:
1. The symbol V_{IN}, in this case, represents the LV_{IN} symbol referenced in Table 1 and Table 2.

9.2 MII, RMII, RGMII, and RTBI AC Timing Specifications

The AC timing specifications for MII, RMII, RGMII, and RTBI are presented in this section.

9.2.1 MII AC Timing Specifications

This section describes the MII transmit and receive AC timing specifications.

9.2.1.1 MII Transmit AC Timing Specifications

This table provides the MII transmit AC timing specifications.

Table 25. MII Transmit AC Timing Specifications

At recommended operating conditions with LVDD of 3.3 V ± 300 mv.

Parameter/Condition	Symbol [1]	Min	Typ	Max	Unit
TX_CLK clock period 10 Mbps	t_{MTX}	—	400	—	ns
TX_CLK clock period 100 Mbps	t_{MTX}	—	40	—	ns
TX_CLK duty cycle	t_{MTXH}/t_{MTX}	35	—	65	%
TX_CLK to MII data TXD[3:0], TX_ER, TX_EN delay	t_{MTKHDX}	1	5	15	ns
TX_CLK data clock rise V_{IL}(min) to V_{IH}(max)	t_{MTXR}	1.0	—	4.0	ns
TX_CLK data clock fall V_{IH}(max) to V_{IL}(min)	t_{MTXF}	1.0	—	4.0	ns

Note:
1. The symbols used for timing specifications follow the pattern of $t_{\text{(first two letters of functional block)(signal)(state)(reference)(state)}}$ for inputs and $t_{\text{(first two letters of functional block)(reference)(state)(signal)(state)}}$ for outputs. For example, t_{MTKHDX} symbolizes MII transmit timing (MT) for the time t_{MTX} clock reference (K) going high (H) until data outputs (D) are invalid (X). Note that, in general, the clock reference symbol representation is based on two to three letters representing the clock of a particular functional. For example, the subscript of t_{MTX} represents the MII(M) transmit (TX) clock. For rise and fall times, the latter convention is used with the appropriate letter: R (rise) or F (fall).

This figure shows the MII transmit AC timing diagram.

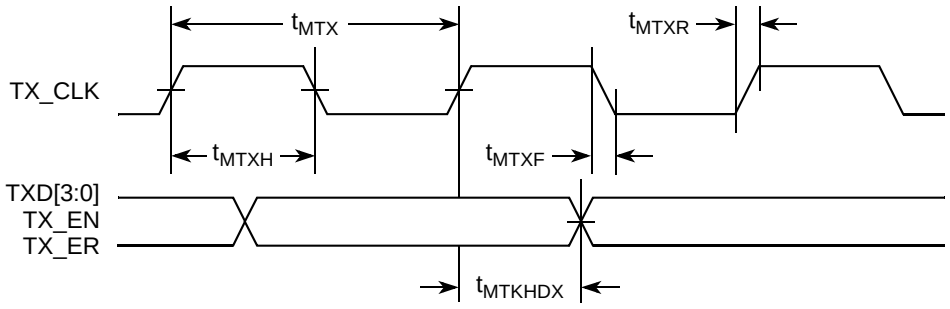

Figure 9. MII Transmit AC Timing Diagram

9.2.2 RMII AC Timing Specifications

This section describes the RMII transmit and receive AC timing specifications.

9.2.2.1 RMII Transmit AC Timing Specifications

This section describes the RMII transmit and receive AC timing specifications. This table provides the RMII transmit AC timing specifications.

Table 27. RMII Transmit AC Timing Specifications

At recommended operating conditions with LVDD of 3.3 V ± 300 mv

Parameter/Condition	Symbol [1]	Min	Typ	Max	Unit
REF_CLK clock	t_{RMX}	—	20	—	ns
REF_CLK duty cycle	t_{RMXH}/t_{RMX}	35	—	65	%
REF_CLK to RMII data TXD[1:0], TX_EN delay	$t_{RMTKHDX}$	2	—	10	ns
REF_CLK data clock rise V_{IL}(min) to V_{IH}(max)	t_{RMXR}	1.0	—	4.0	ns
REF_CLK data clock fall V_{IH}(max) to V_{IL}(min)	t_{RMXF}	1.0	—	4.0	ns

Note:

1. The symbols used for timing specifications herein follow the pattern of $t_{\text{(first three letters of functional block)(signal)(state) (reference)(state)}}$ for inputs and $t_{\text{(first two letters of functional block)(reference)(state)(signal)(state)}}$ for outputs. For example, $t_{RMTKHDX}$ symbolizes RMII transmit timing (RMT) for the time t_{RMX} clock reference (K) going high (H) until data outputs (D) are invalid (X). Note that, in general, the clock reference symbol representation is based on two to three letters representing the clock of a particular functional. For example, the subscript of t_{RMX} represents the RMII(RM) reference (X) clock. For rise and fall times, the latter convention is used with the appropriate letter: R (rise) or F (fall).

This figure shows the RMII transmit AC timing diagram.

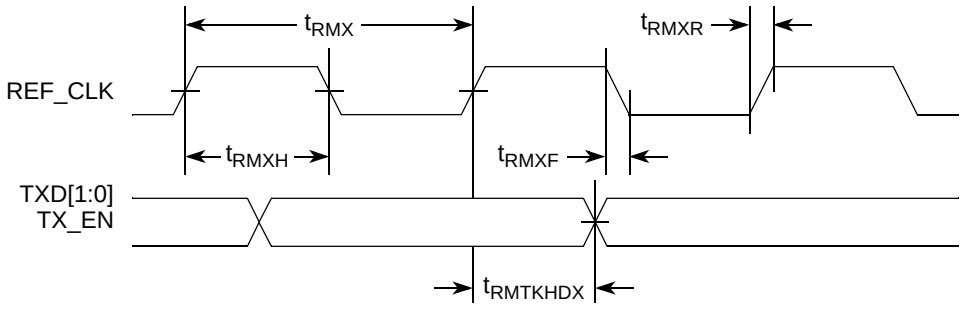

Figure 12. RMII Transmit AC Timing Diagram

9.2.2.2 RMII Receive AC Timing Specifications

This table provides the RMII receive AC timing specifications.

Table 28. RMII Receive AC Timing Specifications

At recommended operating conditions with LVDD of 3.3 V ± 300 mv

Parameter/Condition	Symbol [1]	Min	Typ	Max	Unit
REF_CLK clock period	t_{RMX}	—	20	—	ns
REF_CLK duty cycle	t_{RMXH}/t_{RMX}	35	—	65	%

Table 29. RGMII and RTBI AC Timing Specifications (continued)

At recommended operating conditions (see Table 2)

Parameter/Condition	Symbol [1]	Min	Typ	Max	Unit
Clock cycle duration [3]	t_{RGT}	7.2	8.0	8.8	ns
Duty cycle for 1000Base-T [4, 5]	t_{RGTH}/t_{RGT}	45	50	55	%
Duty cycle for 10BASE-T and 100BASE-TX [3, 5]	t_{RGTH}/t_{RGT}	40	50	60	%
Rise time (20%–80%)	t_{RGTR}	—	—	0.75	ns
Fall time (20%–80%)	t_{RGTF}	—	—	0.75	ns
GTX_CLK125 reference clock period	t_{G12} [6]	—	8.0	—	ns
GTX_CLK125 reference clock duty cycle	t_{G125H}/t_{G125}	47	—	53	%

Note:

1. Note that, in general, the clock reference symbol representation for this section is based on the symbols RGT to represent RGMII and RTBI timing. For example, the subscript of t_{RGT} represents the RTBI (T) receive (RX) clock. Note also that the notation for rise (R) and fall (F) times follows the clock symbol that is being represented. For symbols representing skews, the subscript is skew (SK) followed by the clock that is being skewed (RGT).
2. This implies that PC board design requires clocks to be routed so that an additional trace delay of greater than 1.5 ns is added to the associated clock signal.
3. For 10 and 100 Mbps, t_{RGT} scales to 400 ns ± 40 ns and 40 ns ± 4 ns, respectively.
4. Duty cycle may be stretched/shrunk during speed changes or while transitioning to a received packet's clock domains as long as the minimum duty cycle is not violated and stretching occurs for no more than three t_{RGT} of the lowest speed transitioned between.
5. Duty cycle reference is LVDD/2.
6. This symbol is used to represent the external GTX_CLK125 and does not follow the original symbol naming convention. GTX_CLK supply voltage is fixed at 3.3V inside the chip. If PHY supplies a 2.5 V Clock signal on this input, set TSCOMOBI bit of System I/O configuration register (SICRH) as 1. See the *MPC8315E PowerQUICC II Pro Integrated Host Processor Family Reference Manual*.
7. The frequency of RX_CLK should not exceed the TX_CLK by more than 300 ppm

Table 35. SGMII DC Transmitter Electrical Characteristics

Parameter	Symbol	Min	Typ	Max	Unit	Note
Supply Voltage	XCOREVDD	0.95	1.0	1.05	V	—
Output high voltage	VOH	—	—	$XCOREVDD_{-Typ}/2 + \lvert V_{OD}\rvert_{-max}/2$	mV	1
Output low voltage	VOL	$XCOREVDD_{-Typ}/2 - \lvert V_{OD}\rvert_{-max}/2$	—	—	mV	1
Output ringing	V_{RING}	—	—	10	%	—
Output differential voltage[2, 3, 5]	$\lvert V_{OD}\rvert$	323	500	725	mV	Equalization setting: 1.0x
		296	459	665		Equalization setting: 1.09x
		269	417	604		Equalization setting: 1.2x
		243	376	545		Equalization setting: 1.33x
		215	333	483		Equalization setting: 1.5x
		189	292	424		Equalization setting: 1.71x
		162	250	362		Equalization setting: 2.0x
Output offset voltage	V_{OS}	425	500	575	mV	1, 4
Output impedance (single-ended)	R_O	40	—	60	Ω	—
Mismatch in a pair	ΔR_O	—	—	10	%	—
Change in V_{OD} between “0” and “1”	$\Delta \lvert V_{OD}\rvert$	—	—	25	mV	—
Change in V_{OS} between “0” and “1”	ΔV_{OS}	—	—	25	mV	—
Output current on short to GND	I_{SA}, I_{SB}	—	—	40	mA	—

Note:

1. This will not align to DC-coupled SGMII. $XCOREVDD_{-Typ}$=1.0V.
2. $\lvert V_{OD}\rvert = \lvert V_{TXn} - V_{\overline{TXn}}\rvert$. $\lvert V_{OD}\rvert$ is also referred as output differential peak voltage. $V_{TX-DIFFp-p} = 2*\lvert V_{OD}\rvert$.
3. The $\lvert V_{OD}\rvert$ value shown in the table assumes the following transmit equalization setting in the TXEQA (for SerDes lane A) or TXEQE (for SerDes lane E) bit field of MPC8315E’s SerDes Control Register 0:
   - The LSbits (bit [1:3]) of the above bit field is set based on the equalization setting shown in table.
4. V_{OS} is also referred to as output common mode voltage.
5. The $\lvert V_{OD}\rvert$ value shown in the Typ column is based on the condition of $XCOREVDD_{-Typ}$=1.0V, no common mode offset variation (V_{OS} = 500 mV), SerDes transmitter is terminated with 100-Ω differential load between TX[n] and $\overline{TX}$[n].

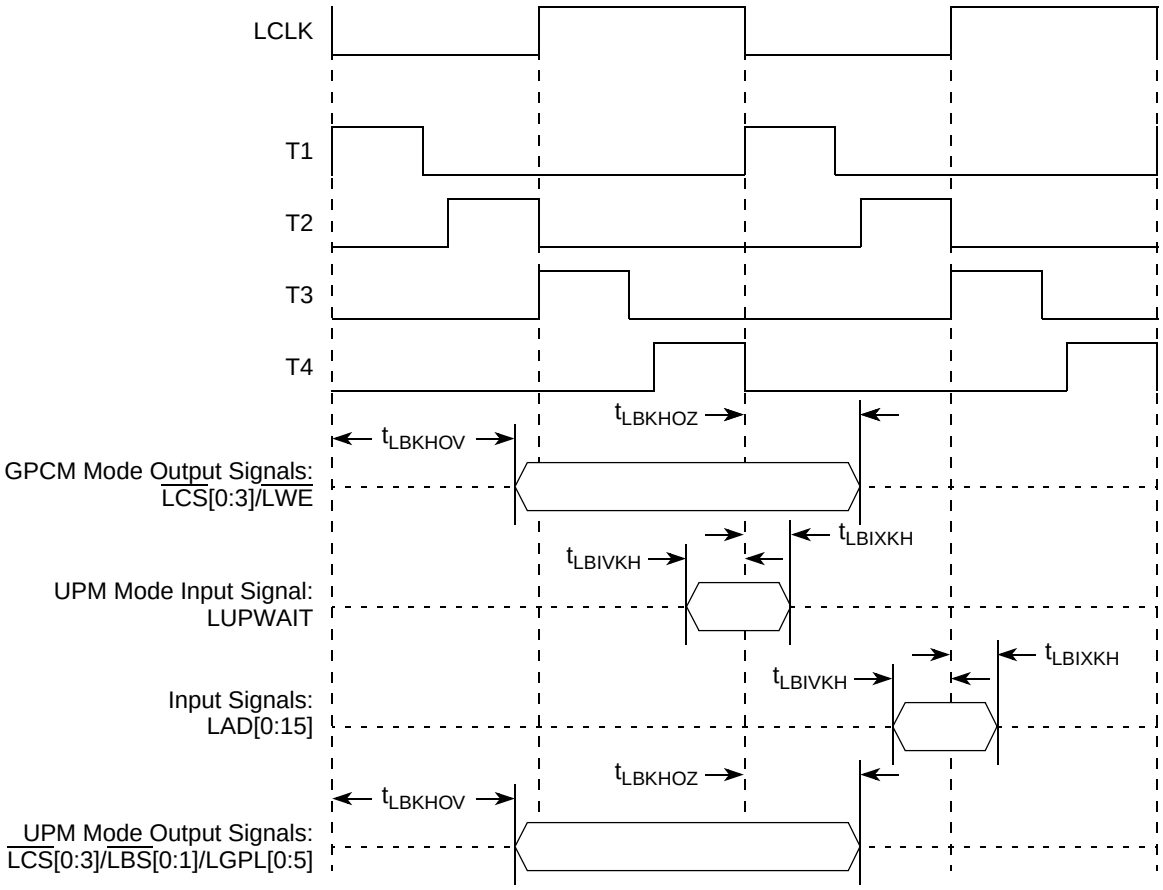

Figure 26. Local Bus Signals, GPCM/UPM Signals for LCRR[CLKDIV] = 4

12 JTAG

This section describes the DC and AC electrical specifications for the IEEE Std 1149.1™ (JTAG) interface.

12.1 JTAG DC Electrical Characteristics

This table provides the DC electrical characteristics for the IEEE 1149.1 (JTAG) interface.

Table 45. JTAG Interface DC Electrical Characteristics

Characteristic	Symbol	Condition	Min	Max	Unit
Input high voltage	V_{IH}	—	2.1	NVDD + 0.3	V
Input low voltage	V_{IL}	—	–0.3	0.8	V
Input current	I_{IN}	—	—	±5	μA
Output high voltage	V_{OH}	I_{OH} = –8.0 mA	2.4	—	V
Output low voltage	V_{OL}	I_{OL} = 8.0 mA	—	0.5	V
Output low voltage	V_{OL}	I_{OL} = 3.2 mA	—	0.4	V

12.2 JTAG AC Timing Specifications

This section describes the AC electrical specifications for the IEEE 1149.1 (JTAG) interface. This table provides the JTAG AC timing specifications as defined in Figure 28 through Figure 31.

Table 46. JTAG AC Timing Specifications (Independent of SYS_CLK_IN) [1]

At recommended operating conditions (see Table 2)

Parameter	Symbol [2]	Min	Max	Unit	Note
JTAG external clock frequency of operation	f_{JTG}	0	33.3	MHz	—
JTAG external clock cycle time	t_{JTG}	30	—	ns	—
JTAG external clock pulse width measured at 1.4 V	t_{JTKHKL}	15	—	ns	—
JTAG external clock rise and fall times	t_{JTGR}, t_{JTGF}	0	2	ns	—
$\overline{\text{TRST}}$ assert time	t_{TRST}	25	—	ns	3
Input setup times: Boundary-scan data TMS, TDI	 t_{JTDVKH} t_{JTIVKH}	 4 4	 — —	ns	4
Input hold times: Boundary-scan data TMS, TDI	 t_{JTDXKH} t_{JTIXKH}	 10 10	 — —	ns	4
Valid times: Boundary-scan data TDO	 t_{JTKLDV} t_{JTKLOV}	 2 2	 11 11	ns	5
Output hold times: Boundary-scan data TDO	 t_{JTKLDX} t_{JTKLOX}	 2 2	 — —	ns	5
JTAG external clock to output high impedance: Boundary-scan data TDO	 t_{JTKLDZ} t_{JTKLOZ}	 2 2	 19 9	ns	5, 6

Note:

1. All outputs are measured from the midpoint voltage of the falling/rising edge of t_{TCLK} to the midpoint of the signal in question. The output timings are measured at the pins. All output timings assume a purely resistive 50-Ω load (see Table 27). Time-of-flight delays must be added for trace lengths, vias, and connectors in the system.
2. The symbols used for timing specifications herein follow the pattern of $t_{\text{(first two letters of functional block)(signal)(state) (reference)(state)}}$ for inputs and $t_{\text{(first two letters of functional block)(reference)(state)(signal)(state)}}$ for outputs. For example, t_{JTDVKH} symbolizes JTAG device timing (JT) with respect to the time data input signals (D) reaching the valid state (V) relative to the t_{JTG} clock reference (K) going to the high (H) state or setup time. Also, t_{JTDXKH} symbolizes JTAG timing (JT) with respect to the time data input signals (D) went invalid (X) relative to the t_{JTG} clock reference (K) going to the high (H) state. Note that, in general, the clock reference symbol representation is based on three letters representing the clock of a particular functional. For rise and fall times, the latter convention is used with the appropriate letter: R (rise) or F (fall).
3. $\overline{\text{TRST}}$ is an asynchronous level sensitive signal. The setup time is for test purposes only.
4. Non-JTAG signal input timing with respect to t_{TCLK}.
5. Non-JTAG signal output timing with respect to t_{TCLK}.
6. Guaranteed by design and characterization.

This figure provides the test access port timing diagram.

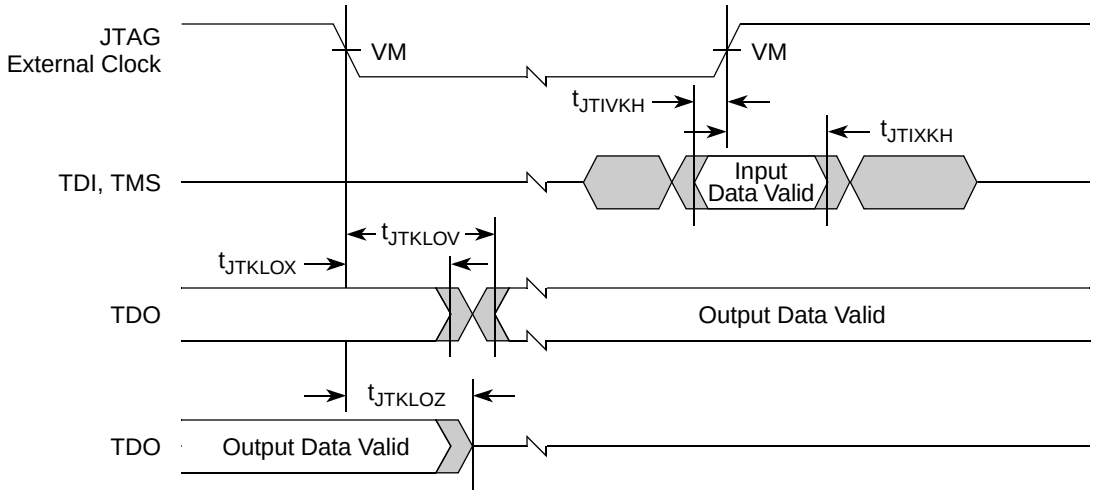

Figure 31. Test Access Port Timing Diagram

13 I²C

This section describes the DC and AC electrical characteristics for the I²C interface of the MPC8314E.

13.1 I²C DC Electrical Characteristics

This table provides the DC electrical characteristics for the I²C interface.

Table 47. I²C DC Electrical Characteristics

At recommended operating conditions with NVDD of 3.3 V ± 300 mv

Parameter	Symbol	Min	Max	Unit	Note
Input high voltage level	V_{IH}	0.7 × NVDD	NVDD + 0.3	V	—
Input low voltage level	V_{IL}	–0.3	0.3 × NVDD	V	—
Low level output voltage	V_{OL}	0	0.2 × NVDD	V	1
High level output voltage	V_{OH}	0.8 × NVDD	NVDD + 0.3	V	—
Output fall time from V_{IH}(min) to V_{IL}(max) with a bus capacitance from 10 to 400 pF	t_{I2KLKV}	20 + 0.1 × C_B	250	ns	2
Pulse width of spikes which must be suppressed by the input filter	t_{I2KHKL}	0	50	ns	3
Capacitance for each I/O pin	C_I	—	10	pF	—
Input current (0 V ≤V_{IN} ≤ NVDD)	I_{IN}	—	± 5	μA	4

Note:

1. Output voltage (open drain or open collector) condition = 3 mA sink current.
2. C_B = capacitance of one bus line in pF.
3. See the *MPC8315E PowerQUICC II Pro Integrated Host Processor Family Reference Manual* for information on the digital filter used.
4. I/O pins obstruct the SDA and SCL lines if NVDD is switched off.

The Differential Output Voltage (or Swing) of the transmitter, V_{OD}, is defined as the difference of the two complimentary output voltages: $V_{TXn} - V_{\overline{TXn}}$. The V_{OD} value can be either positive or negative.

3. **Differential Input Voltage, V_{ID}** (or **Differential Input Swing**):

   The Differential Input Voltage (or Swing) of the receiver, V_{ID}, is defined as the difference of the two complimentary input voltages: $V_{RXn} - V_{\overline{RXn}}$. The V_{ID} value can be either positive or negative.

4. **Differential Peak Voltage, V_{DIFFp}**

   The peak value of the differential transmitter output signal or the differential receiver input signal is defined as Differential Peak Voltage, $V_{DIFFp} = |A - B|$ Volts.

5. **Differential Peak-to-Peak, $V_{DIFFp-p}$**

   Because the differential output signal of the transmitter and the differential input signal of the receiver each range from A – B to –(A – B) Volts, the peak-to-peak value of the differential transmitter output signal or the differential receiver input signal is defined as Differential Peak-to-Peak Voltage, $V_{DIFFp-p} = 2*V_{DIFFp} = 2 * |(A - B)|$ Volts, which is twice of differential swing in amplitude, or twice of the differential peak. For example, the output differential peak-peak voltage can also be calculated as $V_{TX-DIFFp-p} = 2*|V_{OD}|$.

6. **Differential Waveform**

   The differential waveform is constructed by subtracting the inverting signal ($\overline{TXn}$, for example) from the non-inverting signal (TXn, for example) within a differential pair. There is only one signal trace curve in a differential waveform. The voltage represented in the differential waveform is not referenced to ground. Refer to Figure 46 as an example for differential waveform.

7. **Common Mode Voltage, V_{cm}**

   The Common Mode Voltage is equal to one half of the sum of the voltages between each conductor of a balanced interchange circuit and ground. In this example, for SerDes output, $V_{cm\_out} = (V_{TXn} + V_{\overline{TXn}})/2 = (A + B) / 2$, which is the arithmetic mean of the two complimentary output voltages within a differential pair. In a system, the common mode voltage may often differ from one component's output to the other's input. Sometimes, it may be even different between the receiver input and driver output circuits within the same component. It's also referred as the DC offset in some occasion.

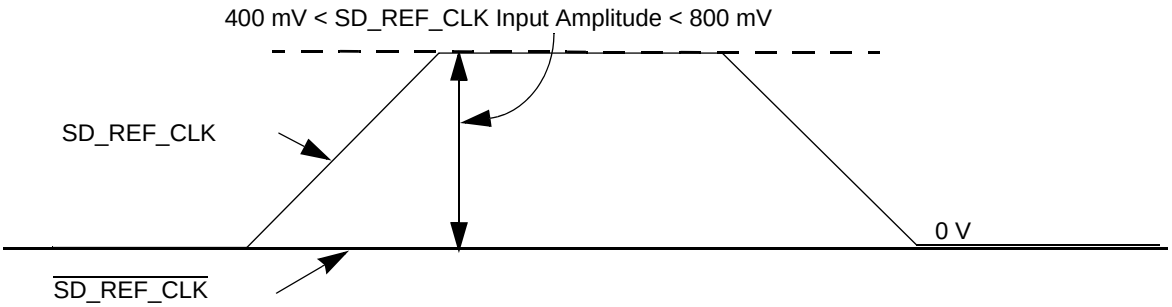

Figure 41. Single-Ended Reference Clock Input DC Requirements

15.2.3 Interfacing With Other Differential Signaling Levels

With on-chip termination to XCOREVSS, the differential reference clocks inputs are HCSL (High-Speed Current Steering Logic) compatible DC-coupled.

Many other low voltage differential type outputs like LVDS (Low Voltage Differential Signaling) can be used but may need to be AC-coupled due to the limited common mode input range allowed (100 to 400 mV) for DC-coupled connection.

LVPECL outputs can produce signal with too large amplitude and may need to be DC-biased at clock driver output first, then followed with series attenuation resistor to reduce the amplitude, in addition to AC-coupling.

NOTE

Figure 42–Figure 45 are for conceptual reference only. Due to the fact that clock driver chip's internal structure, output impedance and termination requirements are different between various clock driver chip manufacturers, it’s very possible that the clock circuit reference designs provided by clock driver chip vendor are different from what is shown below. They might also vary from one vendor to the other. Therefore, Freescale Semiconductor can neither provide the optimal clock driver reference circuits, nor guarantee the correctness of the following clock driver connection reference circuits. The system designer is recommended to contact the selected clock driver chip vendor for the optimal reference circuits with the MPC8315E SerDes reference clock receiver requirement provided in this document.

Table 54. Differential Transmitter (TX) Output Specifications (continued)

Parameter	Symbol	Comments	Min	Typical	Max	Unit	Note
Maximum time to transition to a valid electrical idle after sending an electrical idle ordered set	$T_{TX-IDLE-SET-TO-IDLE}$	After sending an Electrical Idle ordered set, the Transmitter must meet all Electrical Idle Specifications within this time. This is considered a debounce time for the Transmitter to meet Electrical Idle after transitioning from L0.	—	—	20	UI	—
Maximum time to transition to valid TX specifications after leaving an electrical idle condition	$T_{TX-IDLE-TO-DIFF-DATA}$	Maximum time to meet all TX specifications when transitioning from Electrical Idle to sending differential data. This is considered a debounce time for the TX to meet all TX specifications after leaving Electrical Idle	—	—	20	UI	—
Differential return loss	$RL_{TX-DIFF}$	Measured over 50 MHz to 1.25 GHz.	12	—	—	dB	4
Common mode return loss	RL_{TX-CM}	Measured over 50 MHz to 1.25 GHz.	6	—	—	dB	4
DC differential TX impedance	$Z_{TX-DIFF-DC}$	TX DC Differential mode Low Impedance	80	100	120	Ω	—
Transmitter DC impedance	Z_{TX-DC}	Required TX D+ as well as D- DC Impedance during all states	40	—	—	Ω	—
Lane-to-Lane output skew	$L_{TX-SKEW}$	Static skew between any two Transmitter Lanes within a single Link	—	—	500 + 2 UI	ps	—
AC coupling capacitor	C_{TX}	All Transmitters shall be AC coupled. The AC coupling is required either within the media or within the transmitting component itself.	75	—	200	nF	8
Crosslink random timeout	$T_{crosslink}$	This random timeout helps resolve conflicts in crosslink configuration by eventually resulting in only one Downstream and one Upstream Port.	0	—	1	ms	7

Note:

1. No test load is necessarily associated with this value.
2. Specified at the measurement point into a timing and voltage compliance test load as shown in Figure 51 and measured over any 250 consecutive TX UIs. (Also refer to the transmitter compliance eye diagram shown in Figure 49.)
3. A T_{TX-EYE} = 0.70 UI provides for a total sum of deterministic and random jitter budget of $T_{TX-JITTER-MAX}$ = 0.30 UI for the transmitter collected over any 250 consecutive TX UIs. The $T_{TX-EYE-MEDIAN-to-MAX-JITTER}$ median is less than half of the total TX jitter budget collected over any 250 consecutive TX UIs. It should be noted that the median is not the same as the mean. The jitter median describes the point in time where the number of jitter points on either side is approximately equal as opposed to the averaged time value.
4. The transmitter input impedance shall result in a differential return loss greater than or equal to 12 dB and a common mode return loss greater than or equal to 6 dB over a frequency range of 50 MHz to 1.25 GHz. This input impedance requirement applies to all valid input levels. The reference impedance for return loss measurements is 50 Ω to ground for both the D+ and D– line (that is, as measured by a vector network analyzer with 50-Ω probes, see Figure 51). Note that the series capacitors, C_{TX}, is optional for the return loss measurement.
5. Measured between 20%–80% at transmitter package pins into a test load as shown in Figure 51 for both V_{TX-D+} and V_{TX-D-}.
6. See Section 4.3.1.8 of the *PCI Express Base Specifications*, Rev 1.0a.
7. See Section 4.2.6.3 of the *PCI Express Base Specifications*, Rev 1.0a.
8. MPC8315E SerDes transmitter does not have C_{TX} built-in. An external AC Coupling capacitor is required

16.5 Receiver Compliance Eye Diagrams

The RX eye diagram in Figure 50 is specified using the passive compliance/test measurement load (see Figure 51) in place of any real PCI Express RX component. In general, the minimum receiver eye diagram measured with the compliance/test measurement load (see Figure 51) is larger than the minimum receiver eye diagram measured over a range of systems at the input receiver of any real PCI Express component. The degraded eye diagram at the input Receiver is due to traces internal to the package as well as silicon parasitic characteristics which cause the real PCI Express component to vary in impedance from the compliance/test measurement load. The input receiver eye diagram is implementation specific and is not specified. RX component designer should provide additional margin to adequately compensate for the degraded minimum Receiver eye diagram (shown in Figure 50) expected at the input receiver based on an adequate combination of system simulations and the return loss measured looking into the RX package and silicon. The RX eye diagram must be aligned in time using the jitter median to locate the center of the eye diagram.

The eye diagram must be valid for any 250 consecutive UIs.

A recovered TX UI is calculated over 3500 consecutive unit intervals of sample data. The eye diagram is created using all edges of the 250 consecutive UI in the center of the 3500 UI used for calculating the TX UI.

NOTE

The reference impedance for return loss measurements is 50 Ω to ground for both the D+ and D- line (that is, as measured by a Vector Network Analyzer with 50 Ω probes—see Figure 51). Note that the series capacitors, $C_{PEACCTX}$, are optional for the return loss measurement.

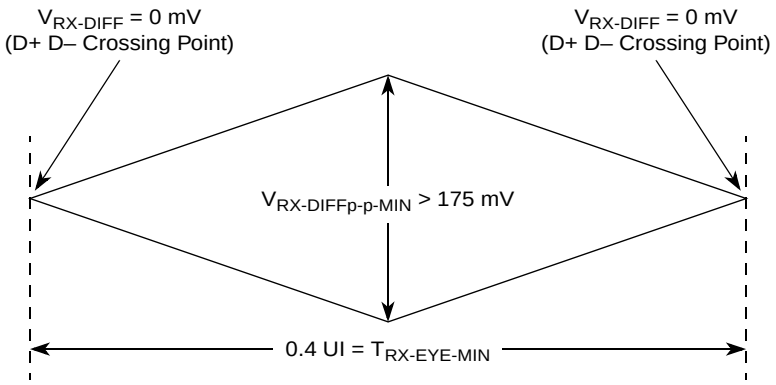

Figure 50. Minimum Receiver Eye Timing and Voltage Compliance Specification

16.5.1 Compliance Test and Measurement Load

The AC timing and voltage parameters must be verified at the measurement point, as specified within 0.2 inches of the package pins, into a test/measurement load shown in Figure 51.

NOTE

The allowance of the measurement point to be within 0.2 inches of the package pins is meant to acknowledge that package/board routing may benefit from D+ and D– not being exactly matched in length at the package pin boundary.

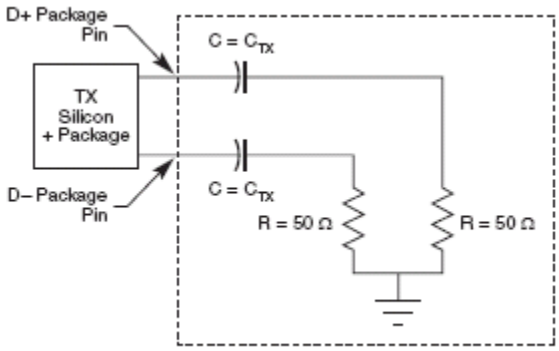

Figure 51. Compliance Test/Measurement Load

17 Timers

This section describes the DC and AC electrical specifications for the timers of the MPC8314E.

17.1 Timers DC Electrical Characteristics

This table provides the DC electrical characteristics for the timers pins, including TIN, $\overline{\text{TOUT}}$, $\overline{\text{TGATE}}$, and RTC_CLK.

Table 56. Timers DC Electrical Characteristics

Characteristic	Symbol	Condition	Min	Max	Unit
Output high voltage	V_{OH}	I_{OH} = –8.0 mA	2.4	—	V
Output low voltage	V_{OL}	I_{OL} = 8.0 mA	—	0.5	V
Output low voltage	V_{OL}	I_{OL} = 3.2 mA	—	0.4	V
Input high voltage	V_{IH}	—	2.1	NVDD + 0.3	V
Input low voltage	V_{IL}	—	–0.3	0.8	V
Input current	I_{IN}	0 V ≤ V_{IN} ≤ NVDD	—	± 5	μA

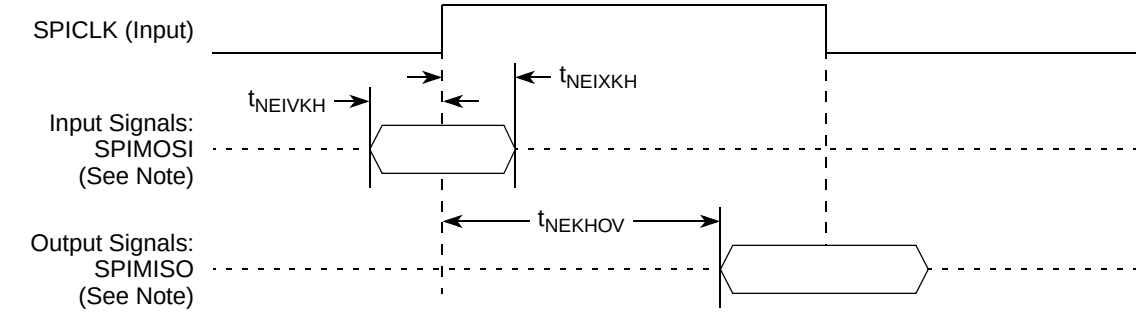
17.2 Timers AC Timing Specifications

This table provides the timers input and output AC timing specifications.

Table 57. Timers Input AC Timing Specifications

Characteristic	Symbol [1]	Min	Unit
Timers inputs—minimum pulse width	t_{TIWID}	20	ns

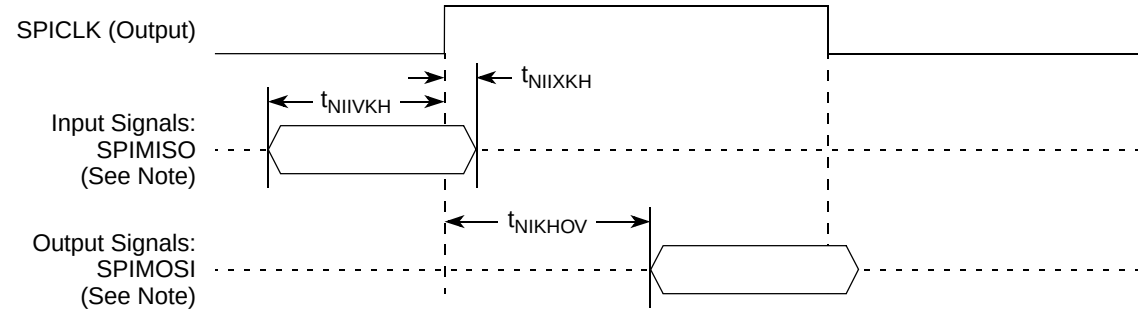
This figure shows the SPI timing in slave mode (external clock).



Note: The clock edge is selectable on SPI.

Figure 55. SPI AC Timing in Slave Mode (External Clock) Diagram

This figure shows the SPI timing in master mode (internal clock).



Note: The clock edge is selectable on SPI.

Figure 56. SPI AC Timing in Master Mode (Internal Clock) Diagram

21 TDM

This section describes the DC and AC electrical specifications for the TDM of the MPC8314E.

21.1 TDM DC Electrical Characteristics

This table provides the DC electrical characteristics TDM.

Table 64. TDM DC Electrical Characteristics

Characteristic	Symbol	Condition	Min	Max	Unit
Output high voltage	V_{OH}	I_{OH} = –8.0 mA	2.4	—	V
Output low voltage	V_{OL}	I_{OL} = 8.0 mA	—	0.5	V
Output low voltage	V_{OL}	I_{OL} = 3.2 mA	—	0.4	V
Input high voltage	V_{IH}	—	2.1	NVDD + 0.3	V
Input low voltage	V_{IL}	—	–0.3	0.8	V
Input current	I_{IN}	0 V ≤ V_{IN} ≤ NVDD	—	± 5	μA

Table 66. MPC8314E TEPBGA II Pinout Listing (continued)

Signal	Package Pin Number	Pin Type	Power Supply	Note

AAVID 43 x 41 x 16.5 mm Pin Fin	1 m/s	8.5
AAVID 43 x 41 x 16.5 mm Pin Fin	2 m/s	7.7
Wakefield, 53 x 53 x 25 mm Pin Fin	Natural Convection	10.9
Wakefield, 53 x 53 x 25 mm Pin Fin	0.5 m/s	8.5
Wakefield, 53 x 53 x 25 mm Pin Fin	1 m/s	7.5
Wakefield, 53 x 53 x 25 mm Pin Fin	2 m/s	7.1

Accurate thermal design requires thermal modeling of the application environment using computational fluid dynamics software which can model both the conduction cooling and the convection cooling of the air moving through the application. Simplified thermal models of the packages can be assembled using the junction-to-case and junction-to-board thermal resistances listed in the thermal resistance table. More detailed thermal models can be made available on request.

Heat sink vendors include the following list:

Aavid Thermalloy 603-224-9988
80 Commercial St.
Concord, NH 03301
Internet: www.aavidthermalloy.com

Alpha Novatech 408-749-7601
473 Sapena Ct. #12
Santa Clara, CA 95054
Internet: www.alphanovatech.com

International Electronic Research Corporation (IERC) 818-842-7277
413 North Moss St.
Burbank, CA 91502

The Bergquist Company 18930 West 78th St. Chanhassen, MN 55317 Internet: www.bergquistcompany.com	800-347-4572

24.3 Heat Sink Attachment

When attaching heat sinks to these devices, an interface material is required. The best method is to use thermal grease and a spring clip. The spring clip should connect to the printed circuit board, either to the board itself, to hooks soldered to the board, or to a plastic stiffener. Avoid attachment forces which would lift the edge of the package or peel the package from the board. Such peeling forces reduce the solder joint lifetime of the package. Recommended maximum force on the top of the package is 10 lb force (45 Newtons). If an adhesive attachment is planned, the adhesive should be intended for attachment to painted or plastic surfaces and its performance verified under the application requirements.
