

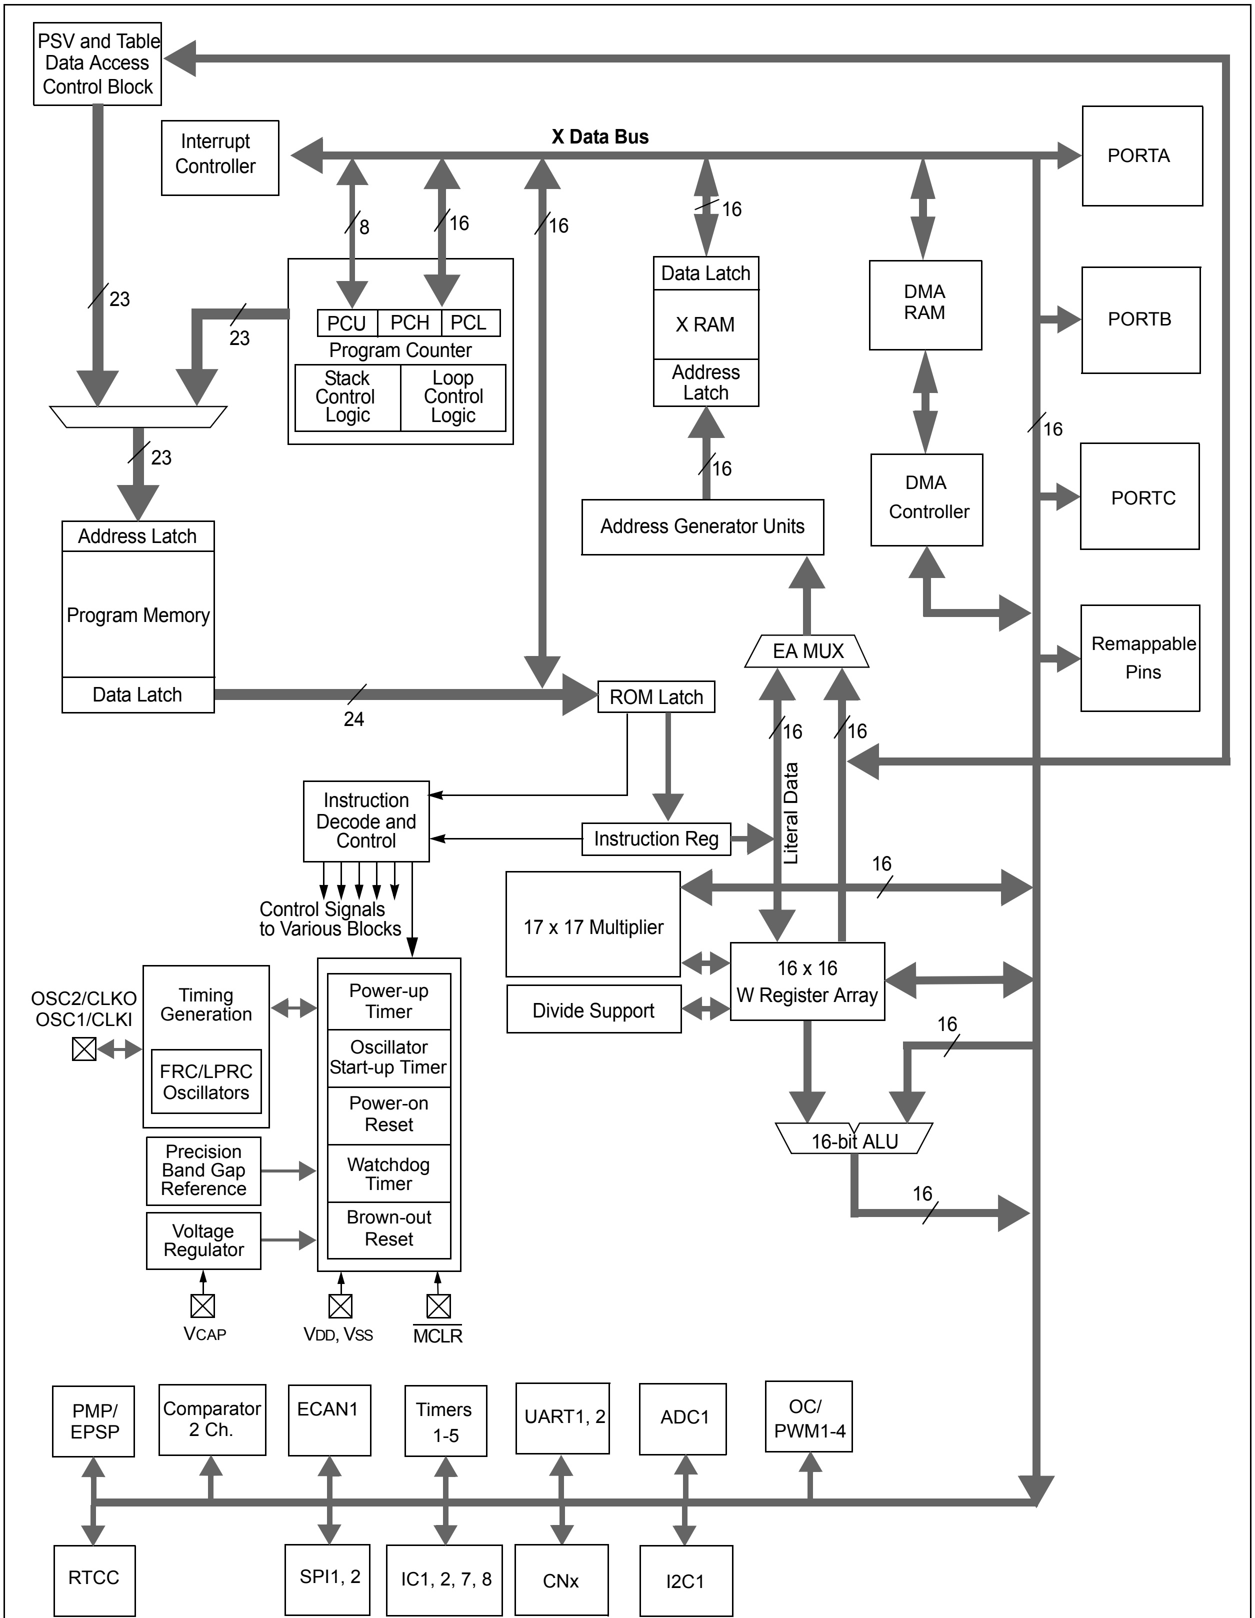
| Details | |
|---|---|
| Product Status | Active |
| Core Processor | PIC |
| Core Size | 16-Bit |
| Speed | 40 MIPs |
| Connectivity | I²C, PMP, SPI, UART/USART |
| Peripherals | Brown-out Detect/Reset, DMA, POR, PWM, WDT |
| Number of I/O | 21 |
| Program Memory Size | 64KB (22K x 24) |
| Program Memory Type | FLASH |
| EEPROM Size | - |
| RAM Size | 8K x 8 |
| Voltage - Supply (Vcc/Vdd) | 3V ~ 3.6V |
| Data Converters | A/D 10x10b/12b |
| Oscillator Type | Internal |
| Operating Temperature | -40°C ~ 85°C (TA) |
| Mounting Type | Through Hole |
| Package / Case | 28-DIP (0.300", 7.62mm) |
| Supplier Device Package | 28-SPDIP |
| Purchase URL | https://www.e-xfl.com/product-detail/microchip-technology/pic24hj64gp202-i-sp |

**FIGURE 1-1: PIC24HJ32GP302/304, PIC24HJ64GPX02/X04 AND PIC24HJ128GPX02/X04 BLOCK DIAGRAM**



**Note:** Not all pins or features are implemented on all device pinout configurations. See **"Pin Diagrams"** for the specific pins and features present on each device.

**Legend:** x = unknown value on Reset, — = unimplemented, read as ‘0’. Reset values are shown in hexadecimal.

**TABLE 6-2: OSCILLATOR DELAY**

| Symbol | Parameter | Value |
|---|---|---|
| VPOR | POR threshold | 1.8V nominal |
| TPOR | POR extension time | 30 µs maximum |
| VBOR | BOR threshold | 2.5V nominal |
| TBOR | BOR extension time | 100 µs maximum |
| TPWRT | Programmable power-up time delay | 0-128 ms nominal |
| TFSCM | Fail-Safe Clock Monitor Delay | 900 µs maximum |

**Note:** When the device exits the Reset condition (begins normal operation), the device operating parameters (voltage, frequency, temperature, etc.) must be within their operating ranges, otherwise the device may not function correctly. The user application must ensure that the delay between the time power is first applied, and the time SYSRST becomes inactive, is long enough to get all operating parameters within specification.

## 6.4 Power-on Reset (POR)

A Power-on Reset (POR) circuit ensures the device is reset from power-on. The POR circuit is active until VDD crosses the VPOR threshold and the delay TPOR has elapsed. The delay TPOR ensures the internal device bias circuits become stable.

The device supply voltage characteristics must meet the specified starting voltage and rise rate requirements to generate the POR. Refer to **Section 28.0 "Electrical Characteristics"** for details.

The POR status bit (POR) in the Reset Control register (RCON<0>) is set to indicate the Power-on Reset.

### 6.4.1 Brown-out Reset (BOR) and Power-up timer (PWRT)

The on-chip regulator has a Brown-out Reset (BOR) circuit that resets the device when the VDD is too low (VDD < VBOR) for proper device operation. The BOR circuit keeps the device in Reset until VDD crosses VBOR threshold and the delay TBOR has elapsed. The delay TBOR ensures the voltage regulator output becomes stable.

The Brown-out Reset status bit (BOR) in the Reset Control register (RCON<1>) is set to indicate the BOR.

The device will not run at full speed after a BOR as the VDD should rise to acceptable levels for full-speed operation. The PWRT provides power-up time delay (TPWRT) to ensure that the system power supplies have stabilized at the appropriate levels for full-speed operation before the SYSRST is released.

The power-up timer delay (TPWRT) is programmed by the Power-on Reset Timer Value Select bits (FPWRT<2:0>) in the POR Configuration register (FPOR<2:0>), which provides eight settings (from 0 ms to 128 ms). Refer to **Section 25.0 "Special Features"** for further details.

Figure 6-3 shows the typical brown-out scenarios. The reset delay (TBOR + TPWRT) is initiated each time VDD rises above the VBOR trip point

**REGISTER 7-19: IPC4: INTERRUPT PRIORITY CONTROL REGISTER 4**

001 = Interrupt is priority 1
000 = Interrupt source is disabled

bit 3 **Unimplemented:** Read as ‘0’

bit 2-0 **SI2C1IP<2:0>:** I2C1 Slave Events Interrupt Priority bits
111 = Interrupt is priority 7 (highest priority interrupt)
•
•
•
001 = Interrupt is priority 1
000 = Interrupt source is disabled

## 7.6 Interrupt Setup Procedures

### 7.6.1 INITIALIZATION

To configure an interrupt source at initialization:

1. Set the NSTDIS bit (INTCON1<15>) if nested interrupts are not desired.
2. Select the user-assigned priority level for the interrupt source by writing the control bits in the appropriate IPCx register. The priority level depends on the specific application and type of interrupt source. If multiple priority levels are not desired, the IPCx register control bits for all enabled interrupt sources can be programmed to the same non-zero value.

| **Note:** | At a device Reset, the IPCx registers are initialized such that all user interrupt sources are assigned to priority level 4. |
|---|---|

3. Clear the interrupt flag status bit associated with the peripheral in the associated IFSx register.
4. Enable the interrupt source by setting the interrupt enable control bit associated with the source in the appropriate IECx register.

### 7.6.2 INTERRUPT SERVICE ROUTINE

The method used to declare an ISR and initialize the IVT with the correct vector address depends on the programming language (C or assembler) and the language development tool suite used to develop the application.

In general, the user application must clear the interrupt flag in the appropriate IFSx register for the source of interrupt that the ISR handles. Otherwise, the program re-enters the ISR immediately after exiting the routine. If the ISR is coded in assembly language, it must be terminated using a `RETFIE` instruction to unstack the saved PC value, SRL value and old CPU priority level.

### 7.6.3 TRAP SERVICE ROUTINE

A Trap Service Routine (TSR) is coded like an ISR, except that the appropriate trap status flag in the INTCON1 register must be cleared to avoid re-entry into the TSR.

### 7.6.4 INTERRUPT DISABLE

All user interrupts can be disabled using this procedure:

1. Push the current SR value onto the software stack using the `PUSH` instruction.
2. Force the CPU to priority level 7 by inclusive ORing the value 0xOE with SRL.

To enable user interrupts, the `POP` instruction can be used to restore the previous SR value.

| **Note:** | Only user interrupts with a priority level of 7 or lower can be disabled. Trap sources (level 8-level 15) cannot be disabled. |
|---|---|

The `DISI` instruction provides a convenient way to disable interrupts of priority levels 1-6 for a fixed period of time. Level 7 interrupt sources are not disabled by the `DISI` instruction.

### REGISTER 8-8: DMACS1: DMA CONTROLLER STATUS REGISTER 1

| U-0 | U-0 | U-0 | U-0 | R-1 | R-1 | R-1 | R-1 |

bit 15-12 **Unimplemented:** Read as ‘0’

bit 11-8 **LSTCH<3:0>:** Last DMA Channel Active bits
1111 = No DMA transfer has occurred since system Reset
1110-1000 = Reserved
0111 = Last data transfer was by DMA Channel 7
0110 = Last data transfer was by DMA Channel 6
0101 = Last data transfer was by DMA Channel 5
0100 = Last data transfer was by DMA Channel 4
0011 = Last data transfer was by DMA Channel 3
0010 = Last data transfer was by DMA Channel 2
0001 = Last data transfer was by DMA Channel 1
0000 = Last data transfer was by DMA Channel 0

bit 7 **PPST7:** Channel 7 Ping-Pong Mode Status Flag bit
1 = DMA7STB register selected
0 = DMA7STA register selected

bit 6 **PPST6:** Channel 6 Ping-Pong Mode Status Flag bit
1 = DMA6STB register selected
0 = DMA6STA register selected

bit 5 **PPST5:** Channel 5 Ping-Pong Mode Status Flag bit
1 = DMA5STB register selected
0 = DMA5STA register selected

bit 4 **PPST4:** Channel 4 Ping-Pong Mode Status Flag bit
1 = DMA4STB register selected
0 = DMA4STA register selected

bit 3 **PPST3:** Channel 3 Ping-Pong Mode Status Flag bit
1 = DMA3STB register selected
0 = DMA3STA register selected

bit 2 **PPST2:** Channel 2 Ping-Pong Mode Status Flag bit
1 = DMA2STB register selected
0 = DMA2STA register selected

bit 1 **PPST1:** Channel 1 Ping-Pong Mode Status Flag bit
1 = DMA1STB register selected
0 = DMA1STA register selected

bit 0 **PPST0:** Channel 0 Ping-Pong Mode Status Flag bit
1 = DMA0STB register selected
0 = DMA0STA register selected

The Timer2/3 and Timer4/5 modules can operate in one of the following modes:

- Timer mode
- Gated Timer mode
- Synchronous Counter mode

In Timer and Gated Timer modes, the input clock is derived from the internal instruction cycle clock (FCY). In Synchronous Counter mode, the input clock is derived from the external clock input at TxCK pin.

The timer modes are determined by the following bits:

- TCS (TxCON<1>): Timer Clock Source Control bit
- TGATE (TxCON<6>): Timer Gate Control bit

Timer control bit settings for different operating modes are given in the Table 13-1.

**TABLE 13-1: TIMER MODE SETTINGS**

| Mode | TCS | TGATE |
|---|---|---|
| Timer | 0 | 0 |
| Gated timer | 0 | 1 |
| Synchronous counter | 1 | x |

## 13.1 16-Bit Operation

To configure any of the timers for individual 16-bit operation:

1. Clear the T32 bit corresponding to that timer.
2. Select the timer prescaler ratio using the TCKPS<1:0> bits.
3. Set the Clock and Gating modes using the TCS and TGATE bits.
4. Load the timer period value into the PRx register.
5. If interrupts are required, set the interrupt enable bit, TxIE. Use the priority bits, TxIP<2:0>, to set the interrupt priority.
6. Set the TON bit.

| **Note:** | Only Timer2 and Timer3 can trigger a DMA data transfer. |
|---|---|

## 13.2 32-Bit Operation

A 32-bit timer module can be formed by combining a Type B and a Type C 16-bit timer module. For 32-bit timer operation, the T32 control bit in the Type B Timer Control register (TxCON<3>) must be set. The Type C timer holds the most significant word (msw) and the Type B timer holds the least significant word (lsw) for 32-bit operation.

When configured for 32-bit operation, only the Type B Timer Control register (TxCON) bits are required for setup and control. Type C timer control register bits are ignored (except TSIDL bit).

For interrupt control, the combined 32-bit timer uses the interrupt enable, interrupt flag and interrupt priority control bits of the Type C timer. The interrupt control and status bits for the Type B timer are ignored during 32-bit timer operation.

The Type B and Type C timers that can be combined to form a 32-bit timer are listed in Table 13-2.

**TABLE 13-2: 32-BIT TIMER**

| TYPE B Timer (lsw) | TYPE C Timer (msw) |
|---|---|
| Timer2 | Timer3 |
| Timer4 | Timer5 |

A block diagram representation of the 32-bit timer module is shown in Figure 13-3. The 32-timer module can operate in one of the following modes:

- Timer mode
- Gated Timer mode
- Synchronous Counter mode

To configure the features of Timer2/3 or Timer4/5 for 32-bit operation:

1. Set the T32 control bit.
2. Select the prescaler ratio for Timer2 or Timer4 using the TCKPS<1:0> bits.
3. Set the Clock and Gating modes using the corresponding TCS and TGATE bits.
4. Load the timer period value. PR3 or PR5 contains the most significant word of the value, while PR2 or PR4 contains the least significant word.
5. If interrupts are required, set the interrupt enable bits, T3IE or T5IE. Use the priority bits, T3IP<2:0> or T5IP<2:0> to set the interrupt priority. While Timer2 or Timer4 controls the timer, the interrupt appears as a Timer3 or Timer5 interrupt.
6. Set the corresponding TON bit.

The timer value at any point is stored in the register pair, TMR3:TMR2 or TMR5:TMR4, which always contains the most significant word of the count, while TMR2 or TMR4 contains the least significant word.

 

### REGISTER 19-3: CiVEC: ECAN™ INTERRUPT CODE REGISTER

0000010 = TRB2 buffer interrupt
0000001 = TRB1 buffer interrupt
0000000 = TRB0 Buffer interrupt

 

## 20.4 ADC Helpful Tips

1. The SMPI<3:0> (AD1CON2<5:2>) control bits:
   a) Determine when the ADC interrupt flag is set and an interrupt is generated if enabled.
   b) When the CSCNA bit (AD1CON2<10>) is set to '1', determines when the ADC analog scan channel list defined in the AD1CSSL/AD1CSSH registers starts over from the beginning.
   c) On devices without a DMA peripheral, determines when ADC result buffer pointer to ADC1BUF0-ADC1BUFF, gets reset back to the beginning at ADC1BUF0.
2. On devices without a DMA module, the ADC has 16 result buffers. ADC conversion results are stored sequentially in ADC1BUF0-ADC1BUFF regardless of which analog inputs are being used subject to the SMPI<3:0> bits (AD1CON2<5:2>) and the condition described in 1c above. There is no relationship between the ANx input being measured and which ADC buffer (ADC1BUF0-ADC1BUFF) that the conversion results will be placed in.
3. On devices with a DMA module, the ADC module has only 1 ADC result buffer, (i.e., ADC1BUF0), per ADC peripheral and the ADC conversion result must be read either by the CPU or DMA controller before the next ADC conversion is complete to avoid overwriting the previous value.
4. The DONE bit (AD1CON1<0>) is only cleared at the start of each conversion and is set at the completion of the conversion, but remains set indefinitely even through the next sample phase until the next conversion begins. If application code is monitoring the DONE bit in any kind of software loop, the user must consider this behavior because the CPU code execution is faster than the ADC. As a result, in manual sample mode, particularly where the users code is setting the SAMP bit (AD1CON1<1>), the DONE bit should also be cleared by the user application just before setting the SAMP bit.
5. On devices with two ADC modules, the ADCxPCFG registers for both ADC modules must be set to a logic '1' to configure a target I/O pin as a digital I/O pin. Failure to do so means that any alternate digital input function will always see only a logic '0' as the digital input buffer is held in Disable mode.

## 20.5 ADC Resources

Many useful resources related to ADC are provided on the main product page of the Microchip web site for the devices listed in this data sheet. This product page, which can be accessed using this link, contains the latest updates and additional information.

| U-0 | U-0 | R/W-x | R/W-x | R/W-x | R/W-x | R/W-x | R/W-x |
|---|---|---|---|---|---|---|---|
| — | — | DAYTEN<1:0> | | DAYONE<3:0> | | | |
| bit 7 | | | | | | | bit 0 |

| Legend: | | | |
|---|---|---|---|
| R = Readable bit | W = Writable bit | U = Unimplemented bit, read as ‘0’ | |
| -n = Value at POR | ‘1’ = Bit is set | ‘0’ = Bit is cleared | x = Bit is unknown |

bit 15-13 **Unimplemented:** Read as ‘0’

bit 12 **MTHTEN0:** Binary Coded Decimal Value of Month’s Tens Digit; contains a value of 0 or 1

bit 11-8 **MTHONE<3:0>:** Binary Coded Decimal Value of Month’s Ones Digit; contains a value from 0 to 9

bit 7-6 **Unimplemented:** Read as ‘0’

bit 5-4 **DAYTEN<1:0>:** Binary Coded Decimal Value of Day’s Tens Digit; contains a value from 0 to 3

bit 3-0 **DAYONE<3:0>:** Binary Coded Decimal Value of Day’s Ones Digit; contains a value from 0 to 9

**Note 1:** A write to this register is only allowed when RTCWREN = 1.

## REGISTER 22-9: ALRMVAL (WHEN ALRMPTR<1:0> = 01): ALARM WEEKDAY AND HOURS VALUE REGISTER[1]

| U-0 | U-0 | U-0 | U-0 | U-0 | R/W-x | R/W-x | R/W-x |
|---|---|---|---|---|---|---|---|
| — | — | — | — | — | WDAY2 | WDAY1 | WDAY0 |
| bit 15 | | | | | | | bit 8 |

| U-0 | U-0 | R/W-x | R/W-x | R/W-x | R/W-x | R/W-x | R/W-x |
|---|---|---|---|---|---|---|---|
| — | — | HRTEN<1:0> | | HRONE<3:0> | | | |
| bit 7 | | | | | | | bit 0 |

| Legend: | | | |
|---|---|---|---|
| R = Readable bit | W = Writable bit | U = Unimplemented bit, read as ‘0’ | |
| -n = Value at POR | ‘1’ = Bit is set | ‘0’ = Bit is cleared | x = Bit is unknown |

bit 15-11 **Unimplemented:** Read as ‘0’

bit 10-8 **WDAY<2:0>:** Binary Coded Decimal Value of Weekday Digit; contains a value from 0 to 6

bit 7-6 **Unimplemented:** Read as ‘0’

bit 5-4 **HRTEN<1:0>:** Binary Coded Decimal Value of Hour’s Tens Digit; contains a value from 0 to 2

bit 3-0 **HRONE<3:0>:** Binary Coded Decimal Value of Hour’s Ones Digit; contains a value from 0 to 9

**Note 1:** A write to this register is only allowed when RTCWREN = 1.

**NOTES:**

**TABLE 28-9: DC CHARACTERISTICS: I/O PIN INPUT SPECIFICATIONS**

| DC CHARACTERISTICS | | | Standard Operating Conditions: 3.0V to 3.6V (unless otherwise stated)<br>Operating temperature -40°C ≤ TA ≤ +85°C for Industrial<br>-40°C ≤ TA ≤ +125°C for Extended | | | | |
|---|---|---|---|---|---|---|---|
| **Param No.** | **Symbol** | **Characteristic** | **Min** | **Typ(1)** | **Max** | **Units** | **Conditions** |
| DI60a | IICL | **Input Low Injection Current** | 0 | — | -5(5,8) | mA | All pins except VDD, VSS, AVDD, AVSS, $\overline{MCLR}$, VCAP, SOSCI, SOSCO, and RB14 |
| DI60b | IICH | **Input High Injection Current** | 0 | — | +5(6,7,8) | mA | All pins except VDD, VSS, AVDD, AVSS, $\overline{MCLR}$, VCAP, SOSCI, SOSCO, RB14, and digital 5V-tolerant designated pins |
| DI60c | ∑IICT | **Total Input Injection Current (sum of all I/O and control pins)** | -20(9) | — | +20(9) | mA | Absolute instantaneous sum of all ± input injection currents from all I/O pins<br>( \| IICL + \| IICH \| ) ≤ ∑IICT |

**Note 1:** Data in “Typ” column is at 3.3V, 25°C unless otherwise stated.

**2:** The leakage current on the $\overline{MCLR}$ pin is strongly dependent on the applied voltage level. The specified levels represent normal operating conditions. Higher leakage current can be measured at different input voltages.

**3:** Negative current is defined as current sourced by the pin.

**4:** See **“Pin Diagrams”** for the 5V tolerant I/O pins.

**5:** VIL source < (VSS – 0.3). Characterized but not tested.

**6:** Non-5V tolerant pins VIH source > (VDD + 0.3), 5V tolerant pins VIH source > 5.5V. Characterized but not tested.

**7:** Digital 5V tolerant pins cannot tolerate any “positive” input injection current from input sources > 5.5V.

**8:** Injection currents > | 0 | can affect the ADC results by approximately 4-6 counts.

**9:** Any number and/or combination of I/O pins not excluded under IICL or IICH conditions are permitted provided the mathematical “absolute instantaneous” sum of the input injection currents from all pins do not exceed the specified limit. Characterized but not tested.

**TABLE 28-32: SPIx SLAVE MODE (FULL-DUPLEX, CKE = 1, CKP = 0, SMP = 0) TIMING REQUIREMENTS**

| AC CHARACTERISTICS | | | Standard Operating Conditions: 3.0V to 3.6V (unless otherwise stated)<br>Operating temperature -40°C ≤ TA ≤ +85°C for Industrial<br>-40°C ≤ TA ≤ +125°C for Extended | | | | |
|---|---|---|---|---|---|---|---|
| **Param No.** | **Symbol** | **Characteristic(1)** | **Min** | **Typ(2)** | **Max** | **Units** | **Conditions** |
| SP70 | TscP | Maximum SCK Input Frequency | — | — | 15 | MHz | See **Note 3** |
| SP72 | TscF | SCKx Input Fall Time | — | — | — | ns | See parameter DO32 and **Note 4** |
| SP73 | TscR | SCKx Input Rise Time | — | — | — | ns | See parameter DO31 and **Note 4** |
| SP30 | TdoF | SDOx Data Output Fall Time | — | — | — | ns | See parameter DO32 and **Note 4** |
| SP31 | TdoR | SDOx Data Output Rise Time | — | — | — | ns | See parameter DO31 and **Note 4** |
| SP35 | TscH2doV, TscL2doV | SDOx Data Output Valid after SCKx Edge | — | 6 | 20 | ns | — |
| SP36 | TdoV2scH, TdoV2scL | SDOx Data Output Setup to First SCKx Edge | 30 | — | — | ns | — |
| SP40 | TdiV2scH, TdiV2scL | Setup Time of SDIx Data Input to SCKx Edge | 30 | — | — | ns | — |
| SP41 | TscH2diL, TscL2diL | Hold Time of SDIx Data Input to SCKx Edge | 30 | — | — | ns | — |
| SP50 | TssL2scH, TssL2scL | $\overline{\text{SSx}}$ ↓ to SCKx ↑ or SCKx Input | 120 | — | — | ns | — |
| SP51 | TssH2doZ | $\overline{\text{SSx}}$ ↑ to SDOx Output High-Impedance(4) | 10 | — | 50 | ns | — |
| SP52 | TscH2ssH TscL2ssH | $\overline{\text{SSx}}$ after SCKx Edge | 1.5 TCY + 40 | — | — | ns | See **Note 4** |
| SP60 | TssL2doV | SDOx Data Output Valid after $\overline{\text{SSx}}$ Edge | — | — | 50 | ns | — |

**Note 1:** These parameters are characterized, but are not tested in manufacturing.

**2:** Data in “Typ” column is at 3.3V, 25°C unless otherwise stated.

**3:** The minimum clock period for SCKx is 66.7 ns. Therefore, the SCK clock generated by the Master must not violate this specification.

**4:** Assumes 50 pF load on all SPIx pins.

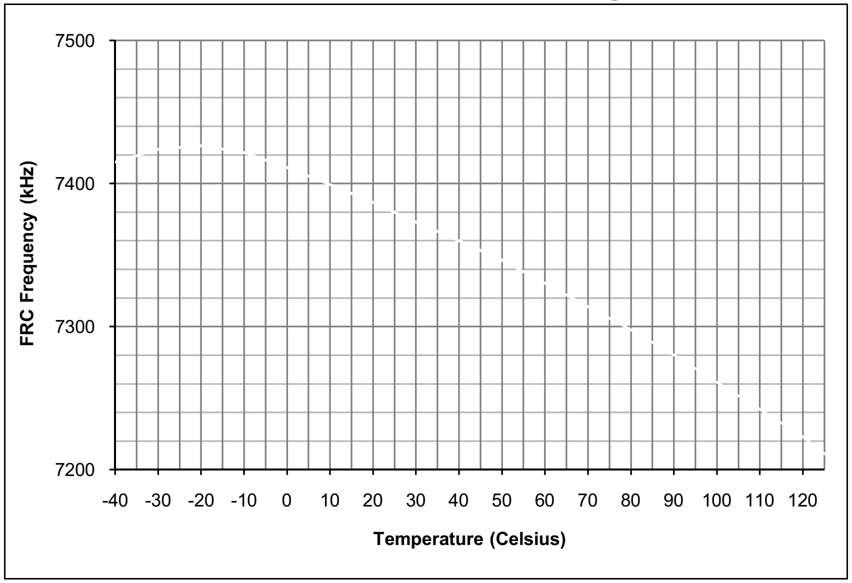

**FIGURE 32-14: TYPICAL LPRC FREQUENCY @ VDD = 3.3V**

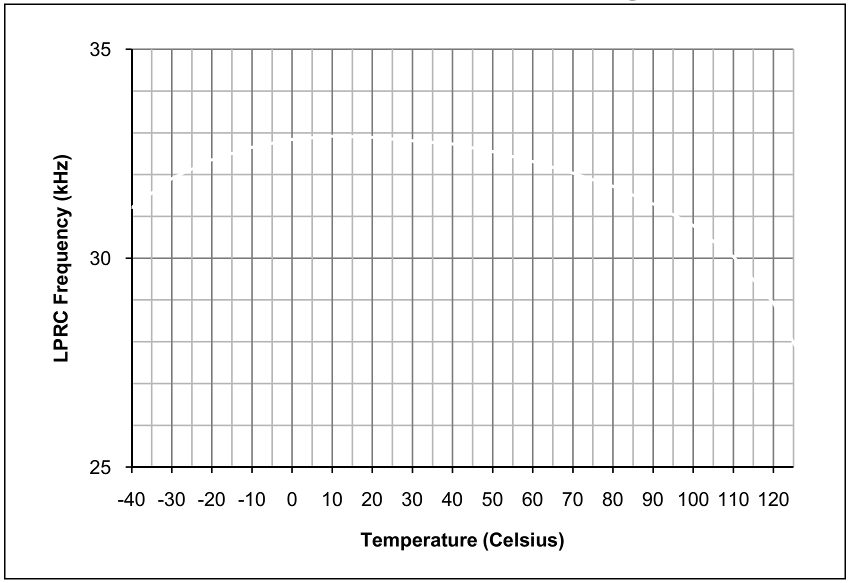

**NOTES:**

# APPENDIX A: REVISION HISTORY

## Revision A (September 2007)

Initial release of this document.

## Revision B (March 2008)

This revision includes minor typographical and formatting changes throughout the data sheet text. In addition, redundant information was removed that is now available in the respective chapters of the *dsPIC33F/PIC24H Family Reference Manual*, which can be obtained from the Microchip web site (www.microchip.com).

The major changes are referenced by their respective section in the following table.

**TABLE A-1: MAJOR SECTION UPDATES**

| Section Name | Update Description |
|---|---|
| **"High-Performance, 16-bit Microcontrollers"** | Note 1 added to all pin diagrams (see **"Pin Diagrams"**)<br>Updated the **"PIC24HJ32GP302/304, PIC24HJ64GPX02/X04 and PIC24HJ128GPX02/X04 Controller Families"** table as follows:<br>• PIC24HJ128GP804 changed to PIC24HJ128GP504<br>• PIC24HJ128GP804 changed to PIC24HJ128GP504<br>• Added new column: External Interrupts<br>• Added Note 3 |
| **Section 1.0 "Device Overview"** | Updated parameters PMA0, PMA1 and PMD0 through PMPD7 (Table 1-1) |
| **Section 6.0 "Interrupt Controller"** | IFS0-IFSO4 changed to IFSx (see **Section 6.3.2 "IFSx"**)<br>IEC0-IEC4 changed to IECx (see **Section 6.3.3 "IECx"**)<br>IPC0-IPC19 changed to IPCx (see **Section 6.3.4 "IPCx"**) |
| **Section 7.0 "Direct Memory Access (DMA)"** | Updated parameter PMP (see Table 7-1) |
| **Section 8.0 "Oscillator Configuration"** | Updated the third clock source item (External Clock) in **Section 8.1.1 "System Clock Sources"**<br>Updated TUN<5:0> (OSCTUN<5:0>) bit description (see Register 8-4) |
| **Section 19.0 "10-bit/12-bit Analog-to-Digital Converter (ADC1)"** | Added Note 2 to Figure 19-3 |
| **Section 24.0 "Special Features"** | Added Note 2 to Figure 24-1<br>Added Note after second paragraph in **Section 24.2 "On-Chip Voltage Regulator"** |

**TABLE A-2: MAJOR SECTION UPDATES (CONTINUED)**

| Section Name | Update Description |
|---|---|
| **Section 28.0 "Electrical Characteristics"** | Updated Typical values for Thermal Packaging Characteristics (see Table 28-3).<br><br>Updated Min and Max values for parameter DC12 (RAM Data Retention Voltage) and added Note 4 (see Table 28-4).<br><br>Updated Power-Down Current Max values for parameters DC60b and DC60c (see Table 28-7).<br><br>Updated Characteristics for I/O Pin Input Specifications (see Table 28-9).<br><br>Updated Program Memory values for parameters 136, 137 and 138 (renamed to 136a, 137a and 138a), added parameters 136b, 137b and 138b, and added Note 2 (see Table 28-12).<br><br>Added parameter OS42 (GM) to the External Clock Timing Requirements (see Table 28-16).<br><br>Updated Watchdog Timer Time-out Period parameter SY20 (see Table 28-21). |

**TABLE A-4: MAJOR SECTION UPDATES (CONTINUED)**

| Section Name | Update Description |
|---|---|
| **Section 28.0 "Electrical Characteristics"** | Updated the maximum value for Extended Temperature Devices in the Thermal Operating Conditions (see Table 28-2).<br><br>Removed Note 4 from the DC Temperature and Voltage Specifications (see Table 28-4).<br><br>Updated all typical and maximum Operating Current ($I_{DD}$) values (see Table 28-5).<br><br>Updated all typical and maximum Idle Current ($I_{IDLE}$) values (see Table 28-6).<br><br>Updated the maximum Power-Down Current ($I_{PD}$) values for parameters DC60d, DC60a, and DC60b (see Table 28-7).<br><br>Updated all typical Doze Current (Idoze) values (see Table 28-8).<br><br>Updated the maximum value for parameter DI19 and added parameters DI28, DI29, DI60a, DI60b, and DI60c to the I/O Pin Input Specifications (see Table 28-9).<br><br>Added Note 2 to the PLL Clock Timing Specifications (see Table 28-17)<br><br>Removed Note 2 from the AC Characteristics: Internal RC Accuracy (see Table 28-18).<br><br>Updated the Internal RC Accuracy minimum and maximum values for parameter F21b (see Table 28-19).<br><br>Updated the characteristic description for parameter DI35 in the I/O Timing Requirements (see Table 28-20).<br><br>Updated *all* SPI specifications (see Table 28-28 through Table 28-35 and Figure 28-10 through Figure 28-16)<br><br>Updated the ADC Module Specification minimum values for parameters AD05 and AD07, and updated the maximum value for parameter AD06 (see Table 28-41).<br><br>Updated the ADC Module Specifications (12-bit Mode) minimum and maximum values for parameter AD21a (see Table 28-42).<br><br>Updated all ADC Module Specifications (10-bit Mode) values, with the exception of Dynamic Performance (see Table 28-43).<br><br>Updated the minimum value for parameter PM6 and the maximum value for parameter PM7 in the Parallel Master Port Read Timing Requirements (see Table 28-49).<br><br>Added DMA Read/Write Timing Requirements (see Table 28-51). |
