

Welcome to [E-XFL.COM](https://www.e-xfl.com)

What is "[Embedded - Microcontrollers](#)"?

"[Embedded - Microcontrollers](#)" refer to small, integrated circuits designed to perform specific tasks within larger systems. These microcontrollers are essentially compact computers on a single chip, containing a processor core, memory, and programmable input/output peripherals. They are called "embedded" because they are embedded within electronic devices to control various functions, rather than serving as standalone computers. Microcontrollers are crucial in modern electronics, providing the intelligence and control needed for a wide range of applications.

Applications of "[Embedded - Microcontrollers](#)"

Details

Product Status	Obsolete
Core Processor	AVR
Core Size	8-Bit
Speed	16MHz
Connectivity	EBI/EMI, I ² C, SPI, UART/USART
Peripherals	Brown-out Detect/Reset, POR, PWM, WDT
Number of I/O	53
Program Memory Size	128KB (64K x 16)
Program Memory Type	FLASH
EEPROM Size	4K x 8
RAM Size	4K x 8
Voltage - Supply (Vcc/Vdd)	4.5V ~ 5.5V
Data Converters	A/D 8x10b
Oscillator Type	Internal
Operating Temperature	-40°C ~ 85°C (TA)
Mounting Type	Surface Mount
Package / Case	64-TQFP
Supplier Device Package	64-TQFP (14x14)
Purchase URL	https://www.e-xfl.com/product-detail/microchip-technology/atmega128-16ai

Pin Configurations

Figure 1. Pinout ATmega128

Note: The Pinout figure applies to both TQFP and MLF packages. The bottom pad under the QFN/MLF package should be soldered to ground.

Overview

The Atmel® AVR® ATmega128 is a low-power CMOS 8-bit microcontroller based on the AVR enhanced RISC architecture. By executing powerful instructions in a single clock cycle, the ATmega128 achieves throughputs approaching 1MIPS per MHz allowing the system designer to optimize power consumption versus processing speed.

The Atmel® AVR® core combines a rich instruction set with 32 general purpose working registers. All the 32 registers are directly connected to the Arithmetic Logic Unit (ALU), allowing two independent registers to be accessed in one single instruction executed in one clock cycle. The resulting architecture is more code efficient while achieving throughputs up to ten times faster than conventional CISC microcontrollers.

The ATmega128 provides the following features: 128Kbytes of In-System Programmable Flash with Read-While-Write capabilities, 4Kbytes EEPROM, 4Kbytes SRAM, 53 general purpose I/O lines, 32 general purpose working registers, Real Time Counter (RTC), four flexible Timer/Counters with compare modes and PWM, 2 USARTs, a byte oriented Two-wire Serial Interface, an 8-channel, 10-bit ADC with optional differential input stage with programmable gain, programmable Watchdog Timer with Internal Oscillator, an SPI serial port, IEEE std. 1149.1 compliant JTAG test interface, also used for accessing the On-chip Debug system and programming and six software selectable power saving modes. The Idle mode stops the CPU while allowing the SRAM, Timer/Counters, SPI port, and interrupt system to continue functioning. The Power-down mode saves the register contents but freezes the Oscillator, disabling all other chip functions until the next interrupt or Hardware Reset. In Power-save mode, the asynchronous timer continues to run, allowing the user to maintain a timer base while the rest of the device is sleeping. The ADC Noise Reduction mode stops the CPU and all I/O modules except Asynchronous Timer and ADC, to minimize switching noise during ADC conversions. In Standby mode, the Crystal/Resonator Oscillator is running while the rest of the device is sleeping. This allows very fast start-up combined with low power consumption. In Extended Standby mode, both the main Oscillator and the Asynchronous Timer continue to run.

Atmel offers the QTouch® library for embedding capacitive touch buttons, sliders and wheels functionality into AVR microcontrollers. The patented charge-transfer signal acquisition offers robust sensing and includes fully debounced reporting of touch keys and includes Adjacent Key Suppression® (AKS™) technology for unambiguous detection of key events. The easy-to-use QTouch Suite toolchain allows you to explore, develop and debug your own touch applications.

The device is manufactured using Atmel's high-density nonvolatile memory technology. The On-chip ISP Flash allows the program memory to be reprogrammed in-system through an SPI serial interface, by a conventional nonvolatile memory programmer, or by an On-chip Boot program running on the AVR core. The boot program can use any interface to download the application program in the application Flash memory. Software in the Boot Flash section will continue to run while the Application Flash section is updated, providing true Read-While-Write operation. By combining an 8-bit RISC CPU with In-System Self-Programmable Flash on a monolithic chip, the Atmel ATmega128 is a powerful microcontroller that provides a highly flexible and cost effective solution to many embedded control applications.

The ATmega128 device is supported with a full suite of program and system development tools including: C compilers, macro assemblers, program debugger/simulators, in-circuit emulators, and evaluation kits.

ATmega103 and ATmega128 Compatibility

The ATmega128 is a highly complex microcontroller where the number of I/O locations supersedes the 64 I/O locations reserved in the AVR instruction set. To ensure backward compatibility with the ATmega103, all I/O locations present in ATmega103 have the same location in ATmega128. Most additional I/O locations are added in an Extended I/O space starting from \$60 to \$FF, (i.e., in the ATmega103 internal RAM space). These locations can be reached by using LD/LDS/LDD and ST/STS/STD instructions only, not by using IN and OUT instructions. The relocation of the internal RAM space may still be a problem for ATmega103 users. Also, the increased number of interrupt vectors might be a problem if the code uses absolute addresses. To solve these problems, an ATmega103 compatibility mode can be selected by programming the fuse M103C. In this mode, none of the functions in the Extended I/O space are in use, so the internal RAM is located as in ATmega103. Also, the Extended Interrupt vectors are removed.

The ATmega128 is 100% pin compatible with ATmega103, and can replace the ATmega103 on current Printed Circuit Boards. The application note “Replacing ATmega103 by ATmega128” describes what the user should be aware of replacing the ATmega103 by an ATmega128.

ATmega103 Compatibility Mode

By programming the M103C fuse, the Atmel® ATmega128 will be compatible with the ATmega103 regards to RAM, I/O pins and interrupt vectors as described above. However, some new features in ATmega128 are not available in this compatibility mode, these features are listed below:

- One USART instead of two, Asynchronous mode only. Only the eight least significant bits of the Baud Rate Register is available.
- One 16 bits Timer/Counter with two compare registers instead of two 16-bit Timer/Counters with three compare registers.
- Two-wire serial interface is not supported.
- Port C is output only.
- Port G serves alternate functions only (not a general I/O port).
- Port F serves as digital input only in addition to analog input to the ADC.
- Boot Loader capabilities is not supported.
- It is not possible to adjust the frequency of the internal calibrated RC Oscillator.
- The External Memory Interface can not release any Address pins for general I/O, neither configure different wait-states to different External Memory Address sections.

In addition, there are some other minor differences to make it more compatible to ATmega103:

- Only EXTRF and PORF exists in MCUCSR.
- Timed sequence not required for Watchdog Time-out change.
- External Interrupt pins 3 - 0 serve as level interrupt only.
- USART has no FIFO buffer, so data overrun comes earlier.

Unused I/O bits in ATmega103 should be written to 0 to ensure same operation in ATmega128.

Pin Descriptions

VCC Digital supply voltage.

GND Ground.

Port A (PA7..PA0) Port A is an 8-bit bi-directional I/O port with internal pull-up resistors (selected for each bit). The Port A output buffers have symmetrical drive characteristics with both high sink and source capability. As inputs, Port A pins that are externally pulled low will source current if the pull-up resistors are activated. The Port A pins are tri-stated when a reset condition becomes active, even if the clock is not running.

Port A also serves the functions of various special features of the ATmega128 as listed on [page 72](#).

Port B (PB7..PB0) Port B is an 8-bit bi-directional I/O port with internal pull-up resistors (selected for each bit). The Port B output buffers have symmetrical drive characteristics with both high sink and source capability. As inputs, Port B pins that are externally pulled low will source current if the pull-up resistors are activated. The Port B pins are tri-stated when a reset condition becomes active, even if the clock is not running.

Port B also serves the functions of various special features of the ATmega128 as listed on [page 73](#).

Port C (PC7..PC0)

Port C is an 8-bit bi-directional I/O port with internal pull-up resistors (selected for each bit). The Port C output buffers have symmetrical drive characteristics with both high sink and source capability. As inputs, Port C pins that are externally pulled low will source current if the pull-up resistors are activated. The Port C pins are tri-stated when a reset condition becomes active, even if the clock is not running.

Port C also serves the functions of special features of the Atmel® AVR®ATmega128 as listed on [page 76](#). In ATmega103 compatibility mode, Port C is output only, and the port C pins are not tri-stated when a reset condition becomes active.

Note: The ATmega128 is by default shipped in ATmega103 compatibility mode. Thus, if the parts are not programmed before they are put on the PCB, PORTC will be output during first power up, and until the ATmega103 compatibility mode is disabled.

Port D (PD7..PD0)

Port D is an 8-bit bi-directional I/O port with internal pull-up resistors (selected for each bit). The Port D output buffers have symmetrical drive characteristics with both high sink and source capability. As inputs, Port D pins that are externally pulled low will source current if the pull-up resistors are activated. The Port D pins are tri-stated when a reset condition becomes active, even if the clock is not running.

Port D also serves the functions of various special features of the ATmega128 as listed on [page 77](#).

Port E (PE7..PE0)

Port E is an 8-bit bi-directional I/O port with internal pull-up resistors (selected for each bit). The Port E output buffers have symmetrical drive characteristics with both high sink and source capability. As inputs, Port E pins that are externally pulled low will source current if the pull-up resistors are activated. The Port E pins are tri-stated when a reset condition becomes active, even if the clock is not running.

Port E also serves the functions of various special features of the ATmega128 as listed on [page 80](#).

Port F (PF7..PF0)

Port F serves as the analog inputs to the A/D Converter.

Port F also serves as an 8-bit bi-directional I/O port, if the A/D Converter is not used. Port pins can provide internal pull-up resistors (selected for each bit). The Port F output buffers have symmetrical drive characteristics with both high sink and source capability. As inputs, Port F pins that are externally pulled low will source current if the pull-up resistors are activated. The Port F pins are tri-stated when a reset condition becomes active, even if the clock is not running. If the JTAG interface is enabled, the pull-up resistors on pins PF7(TDI), PF5(TMS), and PF4(TCK) will be activated even if a Reset occurs.

The TDO pin is tri-stated unless TAP states that shift out data are entered.

Port F also serves the functions of the JTAG interface.

In ATmega103 compatibility mode, Port F is an input Port only.

Port G (PG4..PG0)

Port G is a 5-bit bi-directional I/O port with internal pull-up resistors (selected for each bit). The Port G output buffers have symmetrical drive characteristics with both high sink and source capability. As inputs, Port G pins that are externally pulled low will source current if the pull-up resistors are activated. The Port G pins are tri-stated when a reset condition becomes active, even if the clock is not running.

Port G also serves the functions of various special features.

The port G pins are tri-stated when a reset condition becomes active, even if the clock is not running.

In ATmega103 compatibility mode, these pins only serves as strobes signals to the external memory as well as input to the 32kHz Oscillator, and the pins are initialized to PG0 = 1, PG1 = 1, and PG2 = 0 asynchronously when a reset condition becomes active, even if the clock is not running. PG3 and PG4 are oscillator pins.

RESET

Reset input. A low level on this pin for longer than the minimum pulse length will generate a reset, even if the clock is not running. The minimum pulse length is given in [Table 19 on page 50](#). Shorter pulses are not guaranteed to generate a reset.

XTAL1

Input to the inverting Oscillator amplifier and input to the internal clock operating circuit.

XTAL2

Output from the inverting Oscillator amplifier.

AVCC

AVCC is the supply voltage pin for Port F and the A/D Converter. It should be externally connected to V_{CC} , even if the ADC is not used. If the ADC is used, it should be connected to V_{CC} through a low-pass filter.

AREF

AREF is the analog reference pin for the A/D Converter.

PEN

PEN is a programming enable pin for the SPI Serial Programming mode, and is internally pulled high. By holding this pin low during a Power-on Reset, the device will enter the SPI Serial Programming mode. PEN has no function during normal operation.

Resources

A comprehensive set of development tools, application notes, and datasheets are available for download on <http://www.atmel.com/avr>.

Data Retention

Reliability Qualification results show that the projected data retention failure rate is much less than 1 PPM over 20 years at 85°C or 100 years at 25°C

About Code Examples

This datasheet contains simple code examples that briefly show how to use various parts of the device. These code examples assume that the part specific header file is included before compilation. Be aware that not all C compiler vendors include bit definitions in the header files and interrupt handling in C is compiler dependent. Please confirm with the C compiler documentation for more details.

For I/O registers located in extended I/O map, “IN”, “OUT”, “SBIS”, “SBIC”, “CBI”, and “SBI” instructions must be replaced with instructions that allow access to extended I/O. Typically “LDS” and “STS” combined with “SBR”, “SBRC”, “SBR”, and “CBR”.

Capacitive touch sensing

The Atmel QTouch Library provides a simple to use solution to realize touch sensitive interfaces on most Atmel AVR microcontrollers. The QTouch Library includes support for the QTouch and QMatrix acquisition methods.

Touch sensing can be added to any application by linking the appropriate Atmel QTouch Library for the AVR Microcontroller. This is done by using a simple set of APIs to define the touch channels and sensors, and then calling the touch sensing API's to retrieve the channel information and determine the touch sensor states.

The QTouch Library is FREE and downloadable from the Atmel website at the following location: www.atmel.com/qtouchlibrary. For implementation details and other information, refer to the [Atmel QTouch Library User Guide](#) - also available for download from the Atmel website.

Instruction Set Summary (Continued)

Mnemonics	Operands	Description	Operation	Flags	#Clocks
BRIE	k	Branch if Interrupt Enabled	if (I = 1) then PC ← PC + k + 1	None	1 / 2

Errata

The revision letter in this section refers to the revision of the ATmega128 device.

ATmega128 Rev. F to M

- First Analog Comparator conversion may be delayed
- Interrupts may be lost when writing the timer registers in the asynchronous timer
- Stabilizing time needed when changing XDIV Register
- Stabilizing time needed when changing OSCCAL Register
- IDCODE masks data from TDI input
- Reading EEPROM by using ST or STS to set EERE bit triggers unexpected interrupt request

1. First Analog Comparator conversion may be delayed

If the device is powered by a slow rising V_{CC} , the first Analog Comparator conversion will take longer than expected on some devices.

Problem Fix/Workaround

When the device has been powered or reset, disable then enable the Analog Comparator before the first conversion.

2. Interrupts may be lost when writing the timer registers in the asynchronous timer

The interrupt will be lost if a timer register that is synchronous timer clock is written when the asynchronous Timer/Counter register (TCNTx) is 0x00.

Problem Fix/Workaround

Always check that the asynchronous Timer/Counter register neither have the value 0xFF nor 0x00 before writing to the asynchronous Timer Control Register (TCCRx), asynchronous Timer Counter Register (TCNTx), or asynchronous Output Compare Register (OCRx).

3. Stabilizing time needed when changing XDIV Register

After increasing the source clock frequency more than 2% with settings in the XDIV register, the device may execute some of the subsequent instructions incorrectly.

Problem Fix / Workaround

The NOP instruction will always be executed correctly also right after a frequency change. Thus, the next 8 instructions after the change should be NOP instructions. To ensure this, follow this procedure:

1. Clear the I bit in the SREG Register.
2. Set the new pre-scaling factor in XDIV register.
3. Execute 8 NOP instructions
4. Set the I bit in SREG

This will ensure that all subsequent instructions will execute correctly.

Assembly Code Example:

```

CLI                ; clear global interrupt enable
OUT  XDIV, temp    ; set new prescale value
NOP                ; no operation
NOP                ; no operation
NOP                ; no operation
NOP                ; no operation
NOP                ; no operation
NOP                ; no operation
NOP                ; no operation
NOP                ; no operation
NOP                ; no operation

```

```
SEI ; set global interrupt enable
```

4. Stabilizing time needed when changing OSCCAL Register

After increasing the source clock frequency more than 2% with settings in the OSCCAL register, the device may execute some of the subsequent instructions incorrectly.

Problem Fix / Workaround

The behavior follows errata number 3., and the same Fix / Workaround is applicable on this errata.

5. IDCODE masks data from TDI input

The JTAG instruction IDCODE is not working correctly. Data to succeeding devices are replaced by all-ones during Update-DR.

Problem Fix / Workaround

- If ATmega128 is the only device in the scan chain, the problem is not visible.
- Select the Device ID Register of the ATmega128 by issuing the IDCODE instruction or by entering the Test-Logic-Reset state of the TAP controller to read out the contents of its Device ID Register and possibly data from succeeding devices of the scan chain. Issue the BYPASS instruction to the ATmega128 while reading the Device ID Registers of preceding devices of the boundary scan chain.
- If the Device IDs of all devices in the boundary scan chain must be captured simultaneously, the ATmega128 must be the first device in the chain.

6. Reading EEPROM by using ST or STS to set EERE bit triggers unexpected interrupt request.

Reading EEPROM by using the ST or STS command to set the EERE bit in the EECR register triggers an unexpected EEPROM interrupt request.

Problem Fix / Workaround

Always use OUT or SBI to set EERE in EECR.

R_{RST} maximum value changed from 60kΩ to 85kΩ. 3. Updated “Ordering Information” on page 12 to include Tape & Reel devices. |
| Rev. 2467V-02/11 | <ol style="list-style-type: none"> 1. Updated the literature number (2467) that accidentally changed in rev U. 2. Editing update according to the Atmel new style guide. No more space between the numbers and their units. 3. Reorganized the swapped chapters in rev U: 8-bit Timer/Counter 0, 16-bit TC1 and TC3, and 8-bit TC2 with PWM. |
| Rev. 2467U-08/10 | <ol style="list-style-type: none"> 1. Updated “Ordering Information” on page 12. Added Ordering information for Appendix A ATmega128/L 105°C. |
| Rev. 2467T-07/10 | <ol style="list-style-type: none"> 1. Updated the “USARTn Control and Status Register B – UCSRnB” on page 189. 2. Added a link from “Minimizing Power Consumption” on page 47 to “System Clock and Clock Options” on page 35. 3. Updated use of Technical Terminology in datasheet 4. Corrected formula in Table 133, “Two-wire Serial Bus Requirements,” on page 322 5. Note 6 and Note 7 below Table 133, “Two-wire Serial Bus Requirements,” on page 322 have been removed |
| Rev. 2467S-07/09 | <ol style="list-style-type: none"> 1. Updated the “Errata” on page 15. 2. Updated the TOC with the newest template (version 5.10). 3. Added note “Not recommended from new designs” from the front page. 4. Added typical I_{CC} values for Active and Idle mode in “DC Characteristics” on page 318. |
| Rev. 2467R-06/08 | <ol style="list-style-type: none"> 1. Removed “Not recommended from new designs” from the front page. |

Rev. 2467Q-05/08

1. Updated **“Preventing EEPROM Corruption” on page 24.**
Removed sentence “If the detection level of the internal BOD does not match the needed detection level, and external low V_{CC} Reset Protection circuit can be used.”
2. Updated **Table 85 on page 196** in **“Examples of Baud Rate Setting” on page 193.**
Removed examples of frequencies above 16MHz.
3. Updated **Figure 114 on page 238.**
Inductor value corrected from 10mH to 10μH.
4. Updated description of **“Version” on page 253.**
5. ATmega128L removed from **“DC Characteristics” on page 318.**
6. Added **“Speed Grades” on page 320.**
7. Updated **“Ordering Information” on page 12.**
Pb-Plated packages are no longer offered, and the ordering information for these packages are removed.
There will no longer exist separate ordering codes for commercial operation range, only industrial operation range.
8. Updated **“Errata” on page 15:**
Merged errata description for rev.F to rev.M in **“ATmega128 Rev. F to M”.**

Rev. 2467P-08/07

1. Updated **“Features” on page 1.**
2. Added **“Data Retention” on page 8.**
3. Updated **Table 60 on page 133** and **Table 95 on page 235.**
4. Updated **“C Code Example⁽¹⁾” on page 176.**
5. Updated **Figure 114 on page 238.**
6. Updated **“XTAL Divide Control Register – XDIV” on page 36.**
7. Updated **“Errata” on page 15.**
8. Updated **Table 34 on page 76.**
9. Updated **“Slave Mode” on page 166.**

Rev. 2467O-10/06

1. Added note to **“Timer/Counter Oscillator” on page 43.**
2. Updated **“Fast PWM Mode” on page 124.**
3. Updated **Table 52 on page 104, Table 54 on page 104, Table 59 on page 133, Table 61 on page 134, Table 64 on page 156, and Table 66 on page 157.**
4. Updated **“Errata” on page 15.**

Rev. 2467J-12/03

1. Updated [“Calibrated Internal RC Oscillator”](#) on page 41.

Rev. 2467I-09/03

1. Updated note in [“XTAL Divide Control Register – XDIV”](#) on page 36.
2. Updated [“JTAG Interface and On-chip Debug System”](#) on page 48.
3. Updated values for V_{BOT} (BODLEVEL = 1) in [Table 19](#) on page 50.
4. Updated [“Test Access Port – TAP”](#) on page 246 regarding JTAGEN.
5. Updated description for the JTD bit on [page 255](#).
6. Added a note regarding JTAGEN fuse to [Table 118](#) on page 288.
7. Updated R_{PU} values in [“DC Characteristics”](#) on page 318.
8. Added a proposal for solving problems regarding the JTAG instruction IDCODE in [“Errata”](#) on page 15.

Rev. 2467H-02/03

1. Corrected the names of the two Prescaler bits in the SFIOR Register.
2. Added Chip Erase as a first step under [“Programming the Flash”](#) on page 315 and [“Programming the EEPROM”](#) on page 316.
3. Removed reference to the [“Multipurpose Oscillator”](#) application note and the [“32kHz Crystal Oscillator”](#) application note, which do not exist.
4. Corrected OCn waveforms in [Figure 52](#) on page 125.
5. Various minor Timer1 corrections.
6. Added information about PWM symmetry for Timer0 and Timer2.
7. Various minor TWI corrections.
8. Added reference to [Table 124](#) on page 291 from both SPI Serial Programming and Self Programming to inform about the Flash Page size.
9. Added note under [“Filling the Temporary Buffer \(Page Loading\)”](#) on page 280 about writing to the EEPROM during an SPM Page load.
10. Removed ADHSM completely.
11. Added section [“EEPROM Write During Power-down Sleep Mode”](#) on page 24.
12. Updated drawings in [“Packaging Information”](#) on page 13.

Rev. 2467G-09/02

1. Changed the Endurance on the Flash to 10,000 Write/Erase Cycles.

Rev. 2467F-09/02

1. Added 64-pad QFN/MLF Package and updated [“Ordering Information”](#) on page 12.

2. Added the section **“Using all Locations of External Memory Smaller than 64 Kbyte”** on page 32.
3. Added the section **“Default Clock Source”** on page 37.
4. Renamed SPMCR to SPMCSR in entire document.
5. When using external clock there are some limitations regards to change of frequency. This is descried in **“External Clock”** on page 42 and **Table 131, “External Clock Drive,”** on page 320.
6. Added a sub section regarding OCD-system and power consumption in the section **“Minimizing Power Consumption”** on page 47.
7. Corrected typo (WGM-bit setting) for:
“Fast PWM Mode” on page 98 (Timer/Counter0).
“Phase Correct PWM Mode” on page 100 (Timer/Counter0).
“Fast PWM Mode” on page 151 (Timer/Counter2).
“Phase Correct PWM Mode” on page 152 (Timer/Counter2).
8. Corrected **Table 81 on page 191 (USART)**.
9. Corrected **Table 102 on page 259 (Boundary-Scan)**
10. Updated V_{IL} parameter in **“DC Characteristics”** on page 318.

Rev. 2467E-04/02

1. Updated the Characterization Data in Section **“Typical Characteristics”** on page 333.
2. Updated the following tables:
Table 19 on page 50, Table 20 on page 54, Table 68 on page 157, Table 102 on page 259,
and **Table 136 on page 328.**
3. **Updated Description of OSCCAL Calibration Byte.**
In the data sheet, it was not explained how to take advantage of the calibration bytes for 2MHz, 4MHz, and 8MHz Oscillator selections. This is now added in the following sections:
Improved description of **“Oscillator Calibration Register – OSCCAL”** on page 41 and **“Calibration Byte”** on page 289.

Rev. 2467D-03/02

1. Added more information about **“ATmega103 Compatibility Mode”** on page 5.
2. Updated **Table 2, “EEPROM Programming Time,”** on page 22.
3. Updated typical Start-up Time in **Table 7 on page 37, Table 9 and Table 10 on page 39,**
Table 12 on page 40, Table 14 on page 41, and Table 16 on page 42.
4. Updated **Table 22 on page 56** with typical WDT Time-out.
5. Corrected description of ADSC bit in **“ADC Control and Status Register A – ADCSRA”**
on page 244.

6. Improved description on how to do a polarity check of the ADC differential results in [“ADC Conversion Result” on page 241](#).
7. Corrected JTAG version numbers in [“JTAG Version Numbers” on page 256](#).
8. Improved description of addressing during SPM (usage of RAMPZ) on [“Addressing the Flash During Self-Programming” on page 278](#), [“Performing Page Erase by SPM” on page 280](#), and [“Performing a Page Write” on page 280](#).
9. Added note regarding OCDEN Fuse below [Table 118 on page 288](#).
10. Updated Programming Figures:
[Figure 135 on page 290](#) and [Figure 144 on page 301](#) are updated to also reflect that AVCC must be connected during Programming mode. [Figure 139 on page 297](#) added to illustrate how to program the fuses.
11. Added a note regarding usage of the PROG_PAGELOAD and PROG_PAGEREAD instructions on [page 307](#).
12. Added Calibrated RC Oscillator characterization curves in section [“Typical Characteristics” on page 333](#).
13. Updated [“Two-wire Serial Interface”](#) section.
 More details regarding use of the TWI Power-down operation and using the TWI as master with low TWBRR values are added into the data sheet. Added the note at the end of the [“Bit Rate Generator Unit” on page 203](#). Added the description at the end of [“Address Match Unit” on page 204](#).
14. Added a note regarding usage of Timer/Counter0 combined with the clock. See [“XTAL Divide Control Register – XDIV” on page 36](#).

Rev. 2467C-02/02

1. Corrected Description of Alternate Functions of Port G
 Corrected description of TOSC1 and TOSC2 in [“Alternate Functions of Port G” on page 84](#).
2. Added JTAG Version Numbers for rev. F and rev. G
 Updated Table 100 on page 256.
3. Added Some Preliminary Test Limits and Characterization Data
 Removed some of the TBD's in the following tables and pages:
[Table 19 on page 50](#), [Table 20 on page 54](#), [“DC Characteristics” on page 318](#), [Table 131 on page 320](#), [Table 134 on page 323](#), and [Table 136 on page 328](#).
4. Corrected [“Ordering Information” on page 12](#).
5. Added some Characterization Data in Section [“Typical Characteristics” on page 333](#).
6. Removed Alternative Algorithm for Leaving JTAG Programming Mode.
 See [“Leaving Programming Mode” on page 315](#).
7. Added Description on How to Access the Extended Fuse Byte Through JTAG Programming Mode.

See [“Programming the Fuses”](#) on page 317 and [“Reading the Fuses and Lock Bits”](#) on page 317.
