

Welcome to **E-XFL.COM** 

What is "Embedded - Microcontrollers"?

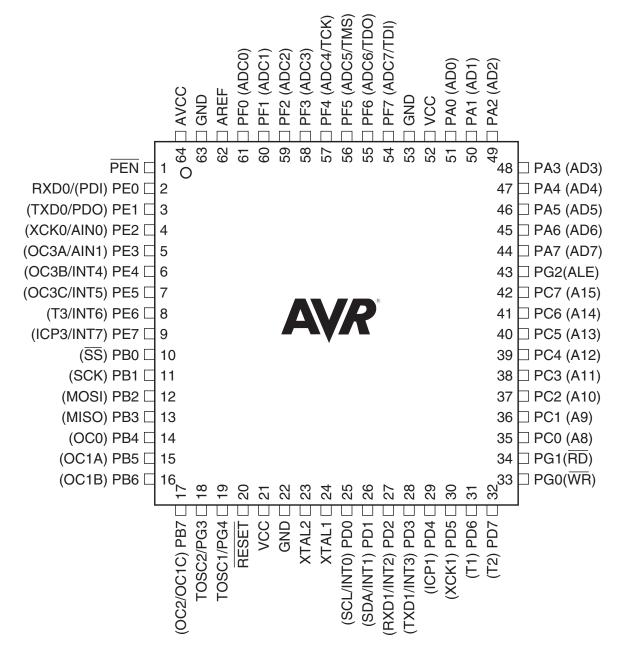

"Embedded - Microcontrollers" refer to small, integrated circuits designed to perform specific tasks within larger systems. These microcontrollers are essentially compact computers on a single chip, containing a processor core, memory, and programmable input/output peripherals. They are called "embedded" because they are embedded within electronic devices to control various functions, rather than serving as standalone computers. Microcontrollers are crucial in modern electronics, providing the intelligence and control needed for a wide range of applications.

Applications of "<u>Embedded - Microcontrollers</u>"

Details	
Product Status	Obsolete
Core Processor	AVR
Core Size	8-Bit
Speed	8MHz
Connectivity	EBI/EMI, I <sup>2</sup> C, SPI, UART/USART
Peripherals	Brown-out Detect/Reset, POR, PWM, WDT
Number of I/O	53
Program Memory Size	128KB (64K x 16)
Program Memory Type	FLASH
EEPROM Size	4K x 8
RAM Size	4K x 8
Voltage - Supply (Vcc/Vdd)	2.7V ~ 5.5V
Data Converters	A/D 8x10b
Oscillator Type	Internal
Operating Temperature	-40°C ~ 85°C (TA)
Mounting Type	Surface Mount
Package / Case	64-VFQFN Exposed Pad
Supplier Device Package	64-QFN (9x9)
Purchase URL	https://www.e-xfl.com/product-detail/microchip-technology/atmega128l-8mc

# Pin Configurations

Figure 1. Pinout ATmega128

Note: The Pinout figure applies to both TQFP and MLF packages. The bottom pad under the QFN/MLF package should be soldered to ground.

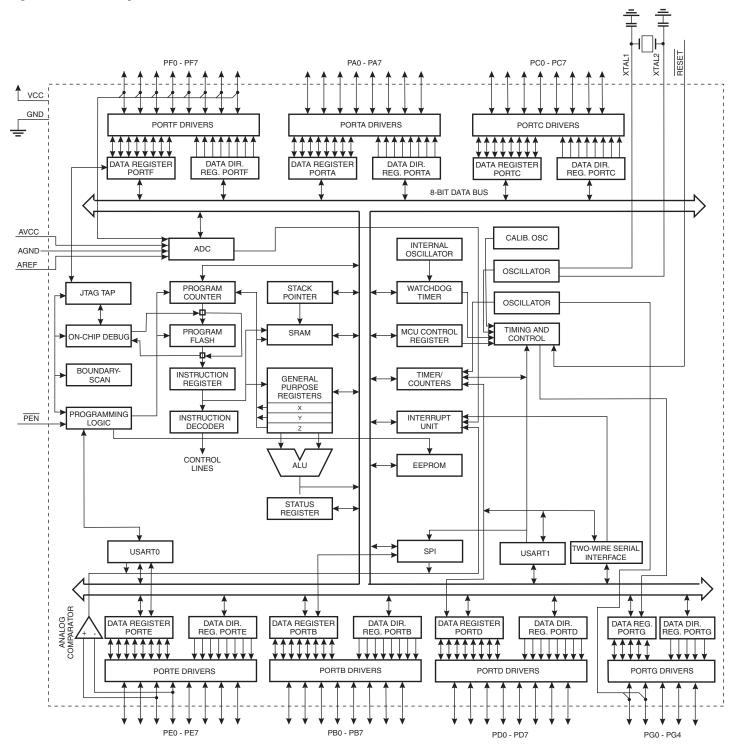

# Overview

The Atmel® AVR® ATmega128 is a low-power CMOS 8-bit microcontroller based on the AVR enhanced RISC architecture. By executing powerful instructions in a single clock cycle, the ATmega128 achieves throughputs approaching 1MIPS per MHz allowing the system designer to optimize power consumption versus processing speed.

# **Block Diagram**

Figure 2. Block Diagram

The Atmel® AVR® core combines a rich instruction set with 32 general purpose working registers. All the 32 registers are directly connected to the Arithmetic Logic Unit (ALU), allowing two independent registers to be accessed in one single instruction executed in one clock cycle. The resulting architecture is more code efficient while achieving throughputs up to ten times faster than conventional CISC microcontrollers.

The ATmega128 provides the following features: 128Kbytes of In-System Programmable Flash with Read-While-Write capabilities, 4Kbytes EEPROM, 4Kbytes SRAM, 53 general purpose I/O lines, 32 general purpose working registers, Real Time Counter (RTC), four flexible Timer/Counters with compare modes and PWM, 2 USARTs, a byte oriented Two-wire Serial Interface, an 8channel, 10-bit ADC with optional differential input stage with programmable gain, programmable Watchdog Timer with Internal Oscillator, an SPI serial port, IEEE std. 1149.1 compliant JTAG test interface, also used for accessing the On-chip Debug system and programming and six software selectable power saving modes. The Idle mode stops the CPU while allowing the SRAM, Timer/Counters, SPI port, and interrupt system to continue functioning. The Power-down mode saves the register contents but freezes the Oscillator, disabling all other chip functions until the next interrupt or Hardware Reset. In Power-save mode, the asynchronous timer continues to run, allowing the user to maintain a timer base while the rest of the device is sleeping. The ADC Noise Reduction mode stops the CPU and all I/O modules except Asynchronous Timer and ADC, to minimize switching noise during ADC conversions. In Standby mode, the Crystal/Resonator Oscillator is running while the rest of the device is sleeping. This allows very fast start-up combined with low power consumption. In Extended Standby mode, both the main Oscillator and the Asynchronous Timer continue to run.

Atmel offers the QTouch® library for embedding capacitive touch buttons, sliders and wheels functionality into AVR microcontrollers. The patented charge-transfer signal acquisition offers robust sensing and includes fully debounced reporting of touch keys and includes Adjacent Key Suppression® (AKS™) technology for unambiguous detection of key events. The easy-to-use QTouch Suite toolchain allows you to explore, develop and debug your own touch applications.

The device is manufactured using Atmel's high-density nonvolatile memory technology. The Onchip ISP Flash allows the program memory to be reprogrammed in-system through an SPI serial interface, by a conventional nonvolatile memory programmer, or by an On-chip Boot program running on the AVR core. The boot program can use any interface to download the application program in the application Flash memory. Software in the Boot Flash section will continue to run while the Application Flash section is updated, providing true Read-While-Write operation. By combining an 8-bit RISC CPU with In-System Self-Programmable Flash on a monolithic chip, the Atmel ATmega128 is a powerful microcontroller that provides a highly flexible and cost effective solution to many embedded control applications.

The ATmega128 device is supported with a full suite of program and system development tools including: C compilers, macro assemblers, program debugger/simulators, in-circuit emulators, and evaluation kits.

# ATmega103 and ATmega128 Compatibility

The ATmega128 is a highly complex microcontroller where the number of I/O locations supersedes the 64 I/O locations reserved in the AVR instruction set. To ensure backward compatibility with the ATmega103, all I/O locations present in ATmega103 have the same location in ATmega128. Most additional I/O locations are added in an Extended I/O space starting from \$60 to \$FF, (i.e., in the ATmega103 internal RAM space). These locations can be reached by using LD/LDS/LDD and ST/STS/STD instructions only, not by using IN and OUT instructions. The relocation of the internal RAM space may still be a problem for ATmega103 users. Also, the increased number of interrupt vectors might be a problem if the code uses absolute addresses. To solve these problems, an ATmega103 compatibility mode can be selected by programming the fuse M103C. In this mode, none of the functions in the Extended I/O space are in use, so the internal RAM is located as in ATmega103. Also, the Extended Interrupt vectors are removed.

The ATmega128 is 100% pin compatible with ATmega103, and can replace the ATmega103 on current Printed Circuit Boards. The application note "Replacing ATmega103 by ATmega128" describes what the user should be aware of replacing the ATmega103 by an ATmega128.

# ATmega103 Compatibility Mode

By programming the M103C fuse, the Atmel®ATmega128 will be compatible with the ATmega103 regards to RAM, I/O pins and interrupt vectors as described above. However, some new features in ATmega128 are not available in this compatibility mode, these features are listed below:

- One USART instead of two, Asynchronous mode only. Only the eight least significant bits of the Baud Rate Register is available.
- One 16 bits Timer/Counter with two compare registers instead of two 16-bit Timer/Counters with three compare registers.
- Two-wire serial interface is not supported.
- Port C is output only.
- Port G serves alternate functions only (not a general I/O port).
- Port F serves as digital input only in addition to analog input to the ADC.
- Boot Loader capabilities is not supported.
- It is not possible to adjust the frequency of the internal calibrated RC Oscillator.
- The External Memory Interface can not release any Address pins for general I/O, neither configure different wait-states to different External Memory Address sections.

In addition, there are some other minor differences to make it more compatible to ATmega103:

- Only EXTRF and PORF exists in MCUCSR.
- Timed sequence not required for Watchdog Time-out change.
- External Interrupt pins 3 0 serve as level interrupt only.
- USART has no FIFO buffer, so data overrun comes earlier.

Unused I/O bits in ATmega103 should be written to 0 to ensure same operation in ATmega128.

# **Pin Descriptions**

VCC

Digital supply voltage.

**GND** 

Ground.

Port A (PA7..PA0)

Port A is an 8-bit bi-directional I/O port with internal pull-up resistors (selected for each bit). The Port A output buffers have symmetrical drive characteristics with both high sink and source capability. As inputs, Port A pins that are externally pulled low will source current if the pull-up resistors are activated. The Port A pins are tri-stated when a reset condition becomes active, even if the clock is not running.

Port A also serves the functions of various special features of the ATmega128 as listed on page 72.

Port B (PB7..PB0)

Port B is an 8-bit bi-directional I/O port with internal pull-up resistors (selected for each bit). The Port B output buffers have symmetrical drive characteristics with both high sink and source capability. As inputs, Port B pins that are externally pulled low will source current if the pull-up resistors are activated. The Port B pins are tri-stated when a reset condition becomes active, even if the clock is not running.

Port B also serves the functions of various special features of the ATmega128 as listed on page 73.

# Port C (PC7..PC0)

Port C is an 8-bit bi-directional I/O port with internal pull-up resistors (selected for each bit). The Port C output buffers have symmetrical drive characteristics with both high sink and source capability. As inputs, Port C pins that are externally pulled low will source current if the pull-up resistors are activated. The Port C pins are tri-stated when a reset condition becomes active, even if the clock is not running.

Port C also serves the functions of special features of the Atmel® AVR®ATmega128 as listed on page 76. In ATmega103 compatibility mode, Port C is output only, and the port C pins are not tristated when a reset condition becomes active.

Note

The ATmega128 is by default shipped in ATmega103 compatibility mode. Thus, if the parts are not programmed before they are put on the PCB, PORTC will be output during first power up, and until the ATmega103 compatibility mode is disabled.

# Port D (PD7..PD0)

Port D is an 8-bit bi-directional I/O port with internal pull-up resistors (selected for each bit). The Port D output buffers have symmetrical drive characteristics with both high sink and source capability. As inputs, Port D pins that are externally pulled low will source current if the pull-up resistors are activated. The Port D pins are tri-stated when a reset condition becomes active, even if the clock is not running.

Port D also serves the functions of various special features of the ATmega128 as listed on page 77.

## Port E (PE7..PE0)

Port E is an 8-bit bi-directional I/O port with internal pull-up resistors (selected for each bit). The Port E output buffers have symmetrical drive characteristics with both high sink and source capability. As inputs, Port E pins that are externally pulled low will source current if the pull-up resistors are activated. The Port E pins are tri-stated when a reset condition becomes active, even if the clock is not running.

Port E also serves the functions of various special features of the ATmega128 as listed on page 80.

## Port F (PF7..PF0)

Port F serves as the analog inputs to the A/D Converter.

Port F also serves as an 8-bit bi-directional I/O port, if the A/D Converter is not used. Port pins can provide internal pull-up resistors (selected for each bit). The Port F output buffers have symmetrical drive characteristics with both high sink and source capability. As inputs, Port F pins that are externally pulled low will source current if the pull-up resistors are activated. The Port F pins are tri-stated when a reset condition becomes active, even if the clock is not running. If the JTAG interface is enabled, the pull-up resistors on pins PF7(TDI), PF5(TMS), and PF4(TCK) will be activated even if a Reset occurs.

The TDO pin is tri-stated unless TAP states that shift out data are entered.

Port F also serves the functions of the JTAG interface.

In ATmega103 compatibility mode, Port F is an input Port only.

## Port G (PG4..PG0)

Port G is a 5-bit bi-directional I/O port with internal pull-up resistors (selected for each bit). The Port G output buffers have symmetrical drive characteristics with both high sink and source capability. As inputs, Port G pins that are externally pulled low will source current if the pull-up resistors are activated. The Port G pins are tri-stated when a reset condition becomes active, even if the clock is not running.

Port G also serves the functions of various special features.

The port G pins are tri-stated when a reset condition becomes active, even if the clock is not running.

In ATmega103 compatibility mode, these pins only serves as strobes signals to the external memory as well as input to the 32kHz Oscillator, and the pins are initialized to PG0 = 1, PG1 = 1, and PG2 = 0 asynchronously when a reset condition becomes active, even if the clock is not running. PG3 and PG4 are oscillator pins.

RESET Reset input. A low level on this pin for longer than the minimum pulse length will generate a

reset, even if the clock is not running. The minimum pulse length is given in Table 19 on page

50. Shorter pulses are not guaranteed to generate a reset.

**XTAL1** Input to the inverting Oscillator amplifier and input to the internal clock operating circuit.

**XTAL2** Output from the inverting Oscillator amplifier.

AVCC is the supply voltage pin for Port F and the A/D Converter. It should be externally con-

nected to  $V_{\text{CC}}$ , even if the ADC is not used. If the ADC is used, it should be connected to  $V_{\text{CC}}$ 

through a low-pass filter.

**AREF** AREF is the analog reference pin for the A/D Converter.

PEN PEN is a programming enable pin for the SPI Serial Programming mode, and is internally pulled

high . By holding this pin low during a Power-on Reset, the device will enter the SPI Serial Pro-

gramming mode. PEN has no function during normal operation.

# **Resources**

A comprehensive set of development tools, application notes, and datasheets are available for download on http://www.atmel.com/avr.

# **Data Retention**

Reliability Qualification results show that the projected data retention failure rate is much less than 1 PPM over 20 years at 85°C or 100 years at 25°C

# About Code Examples

This datasheet contains simple code examples that briefly show how to use various parts of the device. These code examples assume that the part specific header file is included before compilation. Be aware that not all C compiler vendors include bit definitions in the header files and interrupt handling in C is compiler dependent. Please confirm with the C compiler documentation for more details.

For I/O registers located in extended I/O map, "IN", "OUT", "SBIS", "SBIC", "CBI", and "SBI" instructions must be replaced with instructions that allow access to extended I/O. Typically "LDS" and "STS" combined with "SBRS", "SBRC", "SBR", and "CBR".

# Capacitive touch sensing

The Atmel QTouch Library provides a simple to use solution to realize touch sensitive interfaces on most Atmel AVR microcontrollers. The QTouch Library includes support for the QTouch and QMatrix acquisition methods.

Touch sensing can be added to any application by linking the appropriate Atmel QTouch Library for the AVR Microcontroller. This is done by using a simple set of APIs to define the touch channels and sensors, and then calling the touch sensing API's to retrieve the channel information and determine the touch sensor states.

The QTouch Library is FREE and downloadable from the Atmel website at the following location: www.atmel.com/qtouchlibrary. For implementation details and other information, refer to the Atmel QTouch Library User Guide - also available for download from the Atmel website.

# **Instruction Set Summary**

Mnemonics	Operands	Description	Operation	Flags	#Clocks
ARITHMETIC AND I	LOGIC INSTRUCTIONS	S	1	· ·	
ADD	Rd, Rr	Add two Registers	Rd ← Rd + Rr	Z,C,N,V,H	1
ADC	Rd, Rr	Add with Carry two Registers	$Rd \leftarrow Rd + Rr + C$	Z,C,N,V,H	1
ADIW	Rdl,K	Add Immediate to Word	$Rdh : Rdl \leftarrow Rdh : Rdl + K$	Z,C,N,V,S	2

- Notes: 1. Pb-free packaging complies to the European Directive for Restriction of Hazardous Substances (RoHS directive). Also Halide free and fully Green.
  - 2. The device can also be supplied in wafer form. Please contact your local Atmel sales office for detailed ordering information and minimum quantities.
  - 3. Tape and Reel

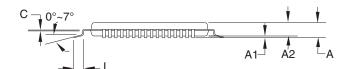

Package Type		
64A	64-lead, 14 x 14 x 1.0mm, Thin Profile Plastic Quad Flat Package (TQFP)	
64M1	64-pad, 9 x 9 x 1.0mm, Quad Flat No-Lead/Micro Lead Frame Package (QFN/MLF)

REV.

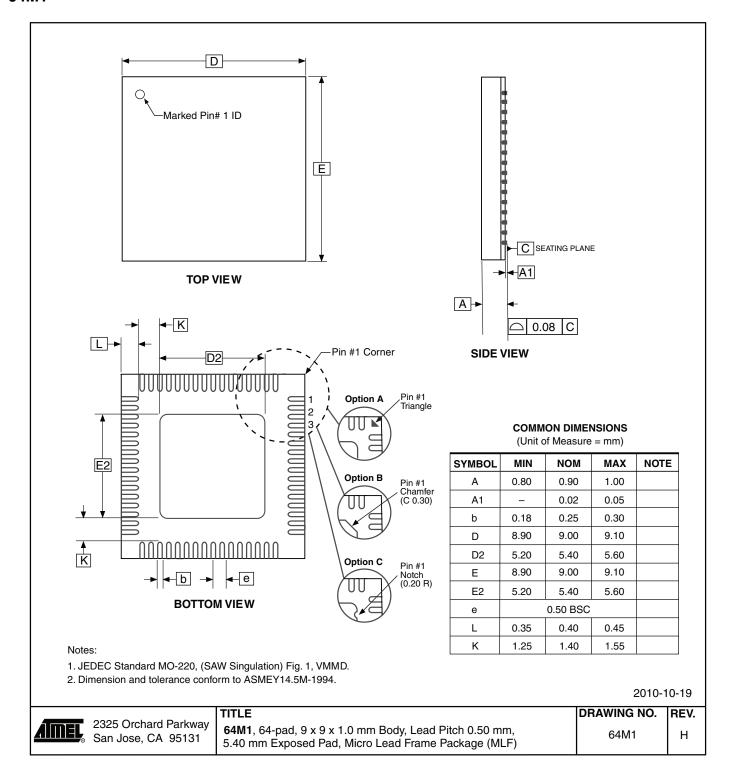

С

- 1. This package conforms to JEDEC reference MS-026, Variation AEB.
- 2. Dimensions D1 and E1 do not include mold protrusion. Allowable protrusion is 0.25 mm per side. Dimensions D1 and E1 are maximum plastic body size dimensions including mold mismatch.
- 3. Lead coplanarity is 0.10 mm maximum.

TITLE	DRAWING NO.
<b>64A</b> , 64-lead, 14 x 14 mm Body Size, 1.0 mm Body Thickness, 0.8 mm Lead Pitch, Thin Profile Plastic Quad Flat Package (TQFP)	64A

# 64M1

SEI ; set global interrupt enable

# 4. Stabilizing time needed when changing OSCCAL Register

After increasing the source clock frequency more than 2% with settings in the OSCCAL register, the device may execute some of the subsequent instructions incorrectly.

### Problem Fix / Workaround

The behavior follows errata number 3., and the same Fix / Workaround is applicable on this errata.

# 5. IDCODE masks data from TDI input

The JTAG instruction IDCODE is not working correctly. Data to succeeding devices are replaced by all-ones during Update-DR.

### Problem Fix / Workaround

- If ATmega128 is the only device in the scan chain, the problem is not visible.
- Select the Device ID Register of the ATmega128 by issuing the IDCODE instruction or by entering the Test-Logic-Reset state of the TAP controller to read out the contents of its Device ID Register and possibly data from succeeding devices of the scan chain. Issue the BYPASS instruction to the ATmega128 while reading the Device ID Registers of preceding devices of the boundary scan chain.
- If the Device IDs of all devices in the boundary scan chain must be captured simultaneously, the ATmega128 must be the fist device in the chain.

# 6. Reading EEPROM by using ST or STS to set EERE bit triggers unexpected interrupt request.

Reading EEPROM by using the ST or STS command to set the EERE bit in the EECR register triggers an unexpected EEPROM interrupt request.

## **Problem Fix / Workaround**

Always use OUT or SBI to set EERE in EECR.

# Datasheet Revision History

Please note that the referring page numbers in this section are referred to this document. The referring revision in this section are referring to the document revision.

Rev. 2467X-06/11

1. Corrected typos in "Ordering Information" on page 12.

Rev. 2467W-05/11

- 1. Added Atmel QTouch Library Support and QTouch Sensing Capability Features.
- 2. Updated "DC Characteristics" on page 318.  $R_{RST}$  maximum value changed from  $60 k\Omega$  to  $85 k\Omega$ .
- 3. Updated "Ordering Information" on page 12 to include Tape & Reel devices.

Rev. 2467V-02/11

- 1. Updated the literature number (2467) that accidently changed in rev U.
- 2. Editing update according to the Atmel new style guide. No more space betweeen the numbers and their units.
- 3. Reorganized the swapped chapters in rev U: 8-bit Timer/Counter 0, 16-bit TC1 and TC3, and 8-bit TC2 with PWM.

Rev. 2467U-08/10

1. Updated "Ordering Information" on page 12. Added Ordering information for Appendix A ATmega128/L 105°C.

Rev. 2467T-07/10

- Updated the "USARTn Control and Status Register B UCSRnB" on page 189.
- 2. Added a link from "Minimizing Power Consumption" on page 47 to "System Clock and Clock Options" on page 35.
- 3. Updated use of Technical Terminology in datasheet
- 4. Corrected formula in Table 133, "Two-wire Serial Bus Requirements," on page 322
- 5. Note 6 and Note 7 below Table 133, "Two-wire Serial Bus Requirements," on page 322 have been removed

Rev. 2467S-07/09

- 1. Updated the "Errata" on page 15.
- 2. Updated the TOC with the newest template (version 5.10).
- 3. Added note "Not recommended from new designs" from the front page.
- 4. Added typical  $I_{CC}$  values for Active and Idle mode in "DC Characteristics" on page 318.

Rev. 2467R-06/08

1. Removed "Not recommended from new designs" from the front page.

# Rev. 2467Q-05/08

1. Updated "Preventing EEPROM Corruption" on page 24.

Removed sentence "If the detection level of the internal BOD does not match the needed detection level, and external low  $V_{\rm CC}$  Reset Protection circuit can be used."

2. Updated Table 85 on page 196 in "Examples of Baud Rate Setting" on page 193.

Remomved examples of frequencies above 16MHz.

3. Updated Figure 114 on page 238.

Inductor value corrected from 10mH to 10µH.

- 4. Updated description of "Version" on page 253.
- 5. ATmega128L removed from "DC Characteristics" on page 318.
- 6. Added "Speed Grades" on page 320.
- 7. Updated "Ordering Information" on page 12.

Pb-Plated packages are no longer offered, and the ordering information for these packages are removed.

There will no longer exist separate ordering codes for commercial operation range, only industrial operation range.

8. Updated "Errata" on page 15:

Merged errata description for rev.F to rev.M in "ATmega128 Rev. F to M".

# Rev. 2467P-08/07

- 1. Updated "Features" on page 1.
- 2. Added "Data Retention" on page 8.
- Updated Table 60 on page 133 and Table 95 on page 235.
- 4. Updated "C Code Example(1)" on page 176.
- 5. Updated Figure 114 on page 238.
- 6. Updated "XTAL Divide Control Register XDIV" on page 36.
- 7. Updated "Errata" on page 15.
- 8. Updated Table 34 on page 76.
- 9. Updated "Slave Mode" on page 166.

# Rev. 2467O-10/06

- 1. Added note to "Timer/Counter Oscillator" on page 43.
- 2. Updated "Fast PWM Mode" on page 124.
- 3. Updated Table 52 on page 104, Table 54 on page 104, Table 59 on page 133, Table 61 on page 134, Table 64 on page 156, and Table 66 on page 157.
- 4. Updated "Errata" on page 15.

## Rev. 2467N-03/06

- 1. Updated note for Figure 1 on page 2.
- 2. Updated "Alternate Functions of Port D" on page 77.
- 3. Updated "Alternate Functions of Port G" on page 84.
- 4. Updated "Phase Correct PWM Mode" on page 100.
- 5. Updated Table 59 on page 133, Table 60 on page 133.
- Updated "Bit 2 TOV3: Timer/Counter3, Overflow Flag" on page 141.
- 7. Updated "Serial Peripheral Interface SPI" on page 162.
- 8. Updated Features in "Analog to Digital Converter" on page 230
- 9. Added note in "Input Channel and Gain Selections" on page 243.
- 10. Updated "Errata" on page 15.

# Rev. 2467M-11/04

- 1. Removed "analog ground", replaced by "ground".
- 2. Updated Table 11 on page 40, Table 114 on page 285, Table 128 on page 303, and Table 132 on page 321. Updated Figure 114 on page 238.
- 3. Added note to "Port C (PC7..PC0)" on page 6.
- 4. Updated "Ordering Information" on page 12.

# Rev. 2467L-05/04

- 1. Removed "Preliminary" and "TBD" from the datasheet, replaced occurrences of ICx with ICPx.
- 2. Updated Table 8 on page 38, Table 19 on page 50, Table 22 on page 56, Table 96 on page 242, Table 126 on page 299, Table 128 on page 303, Table 132 on page 321, and Table 134 on page 323.
- 3. Updated "External Memory Interface" on page 25.
- 4. Updated "Device Identification Register" on page 253.
- 5. Updated "Electrical Characteristics" on page 318.
- 6. Updated "ADC Characteristics" on page 325.
- 7. Updated "Typical Characteristics" on page 333.
- 8. Updated "Ordering Information" on page 12.

# Rev. 2467K-03/04

1. Updated "Errata" on page 15.

Rev. 2467J-12/03

1. Updated "Calibrated Internal RC Oscillator" on page 41.

Rev. 2467I-09/03

- 1. Updated note in "XTAL Divide Control Register XDIV" on page 36.
- 2. Updated "JTAG Interface and On-chip Debug System" on page 48.
- 3. Updated values for  $V_{ROT}$  (BODLEVEL = 1) in Table 19 on page 50.
- 4. Updated "Test Access Port TAP" on page 246 regarding JTAGEN.
- 5. Updated description for the JTD bit on page 255.
- 6. Added a note regarding JTAGEN fuse to Table 118 on page 288.
- 7. Updated R<sub>PII</sub> values in "DC Characteristics" on page 318.
- 8. Added a proposal for solving problems regarding the JTAG instruction IDCODE in "Errata" on page 15.

Rev. 2467H-02/03

- 1. Corrected the names of the two Prescaler bits in the SFIOR Register.
- 2. Added Chip Erase as a first step under "Programming the Flash" on page 315 and "Programming the EEPROM" on page 316.
- 3. Removed reference to the "Multipurpose Oscillator" application note and the "32kHz Crystal Oscillator" application note, which do not exist.
- 4. Corrected OCn waveforms in Figure 52 on page 125.
- 5. Various minor Timer1 corrections.
- 6. Added information about PWM symmetry for Timer0 and Timer2.
- 7. Various minor TWI corrections.
- Added reference to Table 124 on page 291 from both SPI Serial Programming and Self Programming to inform about the Flash Page size.
- 9. Added note under "Filling the Temporary Buffer (Page Loading)" on page 280 about writing to the EEPROM during an SPM Page load.
- 10. Removed ADHSM completely.
- 11. Added section "EEPROM Write During Power-down Sleep Mode" on page 24.
- 12. Updated drawings in "Packaging Information" on page 13.

Rev. 2467G-09/02

- 1. Changed the Endurance on the Flash to 10,000 Write/Erase Cycles.
- Rev. 2467F-09/02
- 1. Added 64-pad QFN/MLF Package and updated "Ordering Information" on page 12.

- 2. Added the section "Using all Locations of External Memory Smaller than 64 Kbyte" on page 32.
- 3. Added the section "Default Clock Source" on page 37.
- 4. Renamed SPMCR to SPMCSR in entire document.
- 5. When using external clock there are some limitations regards to change of frequency. This is descried in "External Clock" on page 42 and Table 131, "External Clock Drive," on page 320.
- 6. Added a sub section regarding OCD-system and power consumption in the section "Minimizing Power Consumption" on page 47.
- 7. Corrected typo (WGM-bit setting) for:
  - "Fast PWM Mode" on page 98 (Timer/Counter0).
  - "Phase Correct PWM Mode" on page 100 (Timer/Counter0).
  - "Fast PWM Mode" on page 151 (Timer/Counter2).
  - "Phase Correct PWM Mode" on page 152 (Timer/Counter2).
- 8. Corrected Table 81 on page 191 (USART).
- 9. Corrected Table 102 on page 259 (Boundary-Scan)
- 10. Updated Vil parameter in "DC Characteristics" on page 318.

# Rev. 2467E-04/02

- 1. Updated the Characterization Data in Section "Typical Characteristics" on page 333.
- 2. Updated the following tables:

Table 19 on page 50, Table 20 on page 54, Table 68 on page 157, Table 102 on page 259, and Table 136 on page 328.

3. Updated Description of OSCCAL Calibration Byte.

In the data sheet, it was not explained how to take advantage of the calibration bytes for 2MHz, 4MHz, and 8MHz Oscillator selections. This is now added in the following sections: Improved description of "Oscillator Calibration Register – OSCCAL" on page 41 and "Calibration Byte" on page 289.

## Rev. 2467D-03/02

- Added more information about "ATmega103 Compatibility Mode" on page 5.
- 2. Updated Table 2, "EEPROM Programming Time," on page 22.
- 3. Updated typical Start-up Time in Table 7 on page 37, Table 9 and Table 10 on page 39, Table 12 on page 40, Table 14 on page 41, and Table 16 on page 42.
- 4. Updated Table 22 on page 56 with typical WDT Time-out.
- 5. Corrected description of ADSC bit in "ADC Control and Status Register A ADCSRA" on page 244.

See "Programming the Fuses" on page 317 and "Reading the Fuses and Lock Bits" on page 317.
