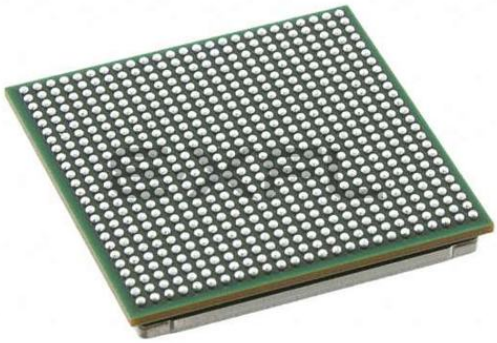
AMD Xilinx - XCZU3EG-1SFVA625E Datasheet



Welcome to E-XFL.COM

Embedded - System On Chip (SoC): The Heart of Modern Embedded Systems

Embedded - System On Chip (SoC) refers to an integrated circuit that consolidates all the essential components of a computer system into a single chip. This includes a microprocessor, memory, and other peripherals, all packed into one compact and efficient package. SoCs are designed to provide a complete computing solution, optimizing both space and power consumption, making them ideal for a wide range of embedded applications.

What are Embedded - System On Chip (SoC)?

System On Chip (SoC) integrates multiple functions of a computer or electronic system onto a single chip. Unlike traditional multi-chip solutions, SoCs combine a central

Details	
Product Status	Active
Architecture	MCU, FPGA
Core Processor	Quad ARM® Cortex®-A53 MPCore™ with CoreSight™, Dual ARM®Cortex™-R5 with CoreSight™, ARM Mali™-400 MP2
Flash Size	-
RAM Size	256KB
Peripherals	DMA, WDT
Connectivity	CANbus, EBI/EMI, Ethernet, I²C, MMC/SD/SDIO, SPI, UART/USART, USB OTG
Speed	500MHz, 600MHz, 1.2GHz
Primary Attributes	Zynq®UltraScale+™ FPGA, 154K+ Logic Cells
Operating Temperature	0°C ~ 100°C (TJ)
Package / Case	625-BFBGA, FCBGA
Supplier Device Package	625-FCBGA (21x21)
Purchase URL	https://www.e-xfl.com/product-detail/xilinx/xczu3eg-1sfva625e

ARM Mali-400 Based GPU

- Supports OpenGL ES 1.1 and 2.0
- Supports OpenVG 1.1
- GPU frequency: Up to 667MHz
- Single Geometry Processor, Two Pixel Processors
- Pixel Fill Rate: 2 Mpixels/sec/MHz
- Triangle Rate: 0.11 Mtriangles/sec/MHz
- 64KB L2 Cache
- Power island gating

External Memory Interfaces

- Multi-protocol dynamic memory controller
- 32-bit or 64-bit interfaces to DDR4, DDR3, DDR3L, or LPDDR3 memories, and 32-bit interface to LPDDR4 memory
- ECC support in 64-bit and 32-bit modes
- Up to 32GB of address space using single or dual rank of 8-, 16-, or 32-bit-wide memories
- Static memory interfaces
  - eMMC4.51 Managed NAND flash support
  - ONFI3.1 NAND flash with 24-bit ECC
  - 1-bit SPI, 2-bit SPI, 4-bit SPI (Quad-SPI), or two Quad-SPI (8-bit) serial NOR flash

8-Channel DMA Controller

- Two DMA controllers of 8-channels each
- Memory-to-memory, memory-to-peripheral, peripheral-to-memory, and scatter-gather transaction support

Serial Transceivers

- Four dedicated PS-GTR receivers and transmitters supports up to 6.0Gb/s data rates
  - Supports SGMII tri-speed Ethernet, PCI Express® Gen2, Serial-ATA (SATA), USB3.0, and DisplayPort

Dedicated I/O Peripherals and Interfaces

- PCI Express — Compliant with PCIe® 2.1 base specification
  - Root complex and End Point configurations
  - x1, x2, and x4 at Gen1 or Gen2 rates
- SATA Host
  - 1.5, 3.0, and 6.0Gb/s data rates as defined by SATA Specification, revision 3.1
  - Supports up to two channels
- DisplayPort Controller
  - Up to 5.4Gb/s rate
  - Up to two TX lanes (no RX support)
- Four 10/100/1000 tri-speed Ethernet MAC peripherals with IEEE Std 802.3 and IEEE Std 1588 revision 2.0 support
  - Scatter-gather DMA capability
  - Recognition of IEEE Std 1588 rev.2 PTP frames
  - GMII, RGMII, and SGMII interfaces
  - Jumbo frames
- Two USB 3.0/2.0 Device, Host, or OTG peripherals, each supporting up to 12 endpoints
  - USB 3.0/2.0 compliant device IP core
  - Super-speed, high- speed, full-speed, and low-speed modes
  - Intel XHCI- compliant USB host
- Two full CAN 2.0B-compliant CAN bus interfaces
  - CAN 2.0-A and CAN 2.0-B and ISO 118981-1 standard compliant
- Two SD/SDIO 2.0/eMMC4.51 compliant controllers
- Two full-duplex SPI ports with three peripheral chip selects
- Two high-speed UARTs (up to 1Mb/s)
- Two master and slave I2C interfaces
- Up to 78 flexible multiplexed I/O (MIO) (up to three banks of 26 I/Os) for peripheral pin assignment
- Up to 96 EMIOs (up to three banks of 32 I/Os) connected to the PL

Interconnect

- High-bandwidth connectivity within PS and between PS and PL
- ARM AMBA® AXI4-based
- QoS support for latency and bandwidth control
- Cache Coherent Interconnect (CCI)

System Memory Management

- System Memory Management Unit (SMMU)
- Xilinx Memory Protection Unit (XMPU)

Platform Management Unit

- Power gates PS peripherals, power islands, and power domains
- Clock gates PS peripheral user firmware option

Configuration and Security Unit

- Boots PS and configures PL
- Supports secure and non-secure boot modes

System Monitor in PS

- On-chip voltage and temperature sensing

Table 4: **Zynq UltraScale+ MPSoC: EG Device-Package Combinations and Maximum I/Os**

Package (1)(2)(3)(4)(5)	Package Dimensions (mm)	ZU2EG	ZU3EG	ZU4EG	ZU5EG	ZU6EG	ZU7EG	ZU9EG	ZU11EG	ZU15EG	ZU17EG	ZU19EG

Notes:

1. Go to Ordering Information for package designation details.(5)
2. FB/FF packages have 1.0mm ball pitch. SB/SF packages have 0.8mm ball pitch.
3. All device package combinations bond out 4 PS-GTR transceivers.
4. All device package combinations bond out 214 PS I/O except ZU2EG and ZU3EG in the SBVA484 and SFVA625 packages, which bond out 170 PS I/Os.
5. Packages with the same last letter and number sequence, e.g., A484, are footprint compatible with all other UltraScale devices with the same sequence. The footprint compatible devices within this family are outlined.
6. All 58 HP I/O pins are powered by the same V_{CCO} supply.
7. GTH transceivers in the SFVC784 package support data rates up to 12.5Gb/s.

Table 5: **Zynq UltraScale+ MPSoC: EV Device Feature Summary**

	ZU4EV	ZU5EV	ZU7EV
Application Processing Unit	Quad-core ARM Cortex-A53 MPCore with CoreSight; NEON & Single/Double Precision Floating Point; 32KB/32KB L1 Cache, 1MB L2 Cache		
Real-Time Processing Unit	Dual-core ARM Cortex-R5 with CoreSight; Single/Double Precision Floating Point; 32KB/32KB L1 Cache, and TCM		
Embedded and External Memory	256KB On-Chip Memory w/ECC; External DDR4; DDR3; DDR3L; LPDDR4; LPDDR3; External Quad-SPI; NAND; eMMC		
General Connectivity	214 PS I/O; UART; CAN; USB 2.0; I2C; SPI; 32b GPIO; Real Time Clock; WatchDog Timers; Triple Timer Counters		
High-Speed Connectivity	4 PS-GTR; PCIe Gen1/2; Serial ATA 3.1; DisplayPort 1.2a; USB 3.0; SGMII		
Graphic Processing Unit	ARM Mali™-400 MP2; 64KB L2 Cache		
Video Codec	1	1	1
System Logic Cells	192,150	256,200	504,000

2. FB/FF packages have 1.0mm ball pitch. SF packages have 0.8mm ball pitch.
3. All device package combinations bond out 4 PS-GTR transceivers.
4. Packages with the same last letter and number sequence, e.g., C784, are footprint compatible with all other UltraScale devices with the same sequence. The footprint compatible devices within this family are outlined.
5. GTH transceivers in the SFVC784 package support data rates up to 12.5Gb/s.

ASIC-class capabilities afforded by the UltraScale MPSoC architecture while supporting rapid system development.

The inclusion of an application processor enables high-level operating system support, e.g., Linux. Other standard operating systems used with the Cortex-A53 processor are also available for the Zynq UltraScale+ MPSoC family. The PS and the PL are on separate power domains, enabling users to power down the PL for power management if required. The processors in the PS always boot first, allowing a software centric approach for PL configuration. PL configuration is managed by software running on the CPU, so it boots similar to an ASSP.

Processing System

Application Processing Unit (APU)

The key features of the APU include:

- 64-bit quad-core ARM Cortex-A53 MPCores. Features associated with each core include:
  - ARM v8-A Architecture
  - Operating target frequency: up to 1.5GHz
  - Single and double precision floating point:
    4 SP / 2 DP FLOPs
  - NEON Advanced SIMD support with single and double precision floating point instructions
  - A64 instruction set in 64-bit operating mode, A32/T32 instruction set in 32-bit operating mode
  - Level 1 cache (separate instruction and data, 32KB each for each Cortex-A53 CPU)
    - 2-way set-associative Instruction Cache with parity support
    - 4-way set-associative Data Cache with ECC support
  - Integrated memory management unit (MMU) per processor core
  - TrustZone for secure mode operation
  - Virtualization support
- Ability to operate in single processor, symmetric quad processor, and asymmetric quad-processor modes
- Integrated 16-way set-associative 1MB Unified Level 2 cache with ECC support
- Interrupts and Timers
  - Generic interrupt controller (GIC-400)
  - ARM generic timers (4 timers per CPU)
  - One watchdog timer (WDT)
  - One global timer
  - Two triple timers/counters (TTC)
- Little and big endian support
  - Big endian support in BE8 mode
- CoreSight debug and trace support
  - Embedded Trace Macrocell (ETM) for instruction trace
  - Cross trigger interface (CTI) enabling hardware breakpoints and triggers
- ACP interface to PL for I/O coherency and Level 2 cache allocation
- ACE interface to PL for full coherency
- Power island gating on each processor core
- Optional eFUSE disable per core

Real-Time Processing Unit (RPU)

- Dual-core ARM Cortex-R5 MPCores. Features associated with each core include:
  - ARM v7-R Architecture (32-bit)
  - Operating target frequency: Up to 600MHz
  - A32/T32 instruction set support
  - 4-way set-associative Level 1 caches (separate instruction and data, 32KB each) with ECC support
  - Integrated Memory Protection Unit (MPU) per processor
  - 128KB Tightly Coupled Memory (TCM) with ECC support
  - TCMs can be combined to become 256KB in lockstep mode
- Ability to operate in single-processor or dual-processor modes (split and lock-step)
- Little and big endian support
- Dedicated SWDT and two Triple Timer Counters (TTC)
- CoreSight debug and trace support
  - Embedded Trace Macrocell (ETM) for instruction and trace
  - Cross trigger interface (CTI) enabling hardware breakpoints and triggers
- Optional eFUSE disable

Full-Power Domain DMA (FPD-DMA) and Low-Power Domain DMA (LPD-DMA)

- Two general-purpose DMA controllers one in the full-power domain (FPD-DMA) and one in the low-power domain (LPD-DMA)
- Eight independent channels per DMA
- Multiple transfer types:
  - Memory-to-memory
  - Memory-to-peripheral
  - Peripheral-to-memory and
  - Scatter-gather
- 8 peripheral interfaces per DMA
- TrustZone per DMA for optional secure operation

- Low power modes
  - Active/precharge power down
  - Self-refresh, including clean exit from self-refresh after a controller power cycle
- Enhanced DDR training by allowing software to measure read/write eye and make delay adjustments dynamically
- Independent performance monitors for read path and write path
- Integration of PHY Debug Access Port (DAP) into JTAG for testing

The DDR memory controller is multi-ported and enables the PS and the PL to have shared access to a common memory. The DDR controller features six AXI slave ports for this purpose:

- Two 128-bit AXI ports from the ARM Cortex-A53 CPU(s), RPU (ARM Cortex-R5 and LPD peripherals), GPU, high speed peripherals (USB3, PCIe & SATA), and High Performance Ports (HP0 & HP1) from the PL through the Cache Coherent Interconnect (CCI)
- One 64-bit port is dedicated for the ARM Cortex-R5 CPU(s)
- One 128-bit AXI port from the DisplayPort and HP2 port from the PL
- One 128-bit AXI port from HP3 and HP4 ports from the PL
- One 128-bit AXI port from General DMA and HP5 from the PL

High-Speed Connectivity Peripherals

PCIe

- Compliant with the PCI Express Base Specification 2.1
- Fully compliant with PCI Express transaction ordering rules
- Lane width: x1, x2, or x4 at Gen1 or Gen2 rates
- 1 Virtual Channel
- Full duplex PCIe port
- End Point and single PCIe link Root Port
- Root Port supports Enhanced Configuration Access Mechanism (ECAM), Cfg Transaction generation
- Root Port support for INTx, and MSI
- Endpoint support for MSI or MSI-X
  - 1 physical function, no SR-IOV
  - No relaxed or ID ordering
  - Fully configurable BARs
  - INTx not recommended, but can be generated
  - Endpoint to support configurable target/slave apertures with address translation and Interrupt capability

SATA

- Compliant with SATA 3.1 Specification
- SATA host port supports up to 2 external devices
- Compliant with Advanced Host Controller Interface ('AHCI') ver. 1.3
- 1.5Gb/s, 3.0Gb/s, and 6.0Gb/s data rates
- Power management features: supports partial and slumber modes

USB 3.0

- Two USB controllers (configurable as USB 2.0 or USB 3.0)
- Up to 5.0Gb/s data rate
- Host and Device modes
  - Super Speed, High Speed, Full Speed, and Low Speed
  - Up to 12 endpoints
  - The USB host controller registers and data structures are compliant to Intel xHCI specifications
  - 64-bit AXI master port with built-in DMA
  - Power management features: Hibernation mode

DisplayPort Controller

- 4K Display Processing with DisplayPort output
  - Maximum resolution of 4K x 2K-30 (30Hz pixel rate)
  - DisplayPort AUX channel, and Hot Plug Detect (HPD) on the output
  - RGB YCbCr, 4:2:0; 4:2:2, 4:4:4 with 6, 8, 10, and 12b/c
  - Y-only, xvYCC, RGB 4:4:4, YCbCr 4:4:4, YCbCr 4:2:2, and YCbCr 4:2:0 video format with 6,8,10 and 12-bits per color component
  - 256-color palette
  - Multiple frame buffer formats
  - 1, 2, 4, 8 bits per pixel (bpp) via a palette
  - 16, 24, 32bpp
  - Graphics formats such as RGBA8888, RGB555, etc.
- Accepts streaming video from the PL or dedicated DMA controller
- Enables Alpha blending of graphics and Chroma keying

- Audio support
  - A single stream carries up to 8 LPCM channels at 192kHz with 24-bit resolution
  - Supports compressed formats including DRA, Dolby MAT, and DTS HD
  - Multi-Stream Transport can extend the number of audio channels
  - Audio copy protection
  - 2-channel streaming or input from the PL
  - Multi-channel non-streaming audio from a memory audio frame buffer
- Includes a System Time Clock (STC) compliant with ISO/IEC 13818-1
- Boot-time display using minimum resources

Platform Management Unit (PMU)

- Performs system initialization during boot
- Acts as a delegate to the application and real-time processors during sleep state
- Initiates power-up and restart after the wake-up request
- Maintains the system power state at all time
- Manages the sequence of low-level events required for power-up, power-down, reset, clock gating, and power gating of islands and domains
- Provides error management (error handling and reporting)
- Provides safety check functions (e.g., memory scrubbing)

The PMU includes the following blocks:

- Platform management processor
- Fixed ROM for boot-up of the device
- 128KB RAM with ECC for optional user/firmware code
- Local and global registers to manage power-down, power-up, reset, clock gating, and power gating requests
- Interrupt controller with 16 interrupts from other modules and the inter-processor communication interface (IPI)
- GPI and GPO interfaces to and from PS I/O and PL
- JTAG interface for PMU debug
- Optional User-Defined Firmware

Configuration Security Unit (CSU)

- Triple redundant Secure Processor Block (SPB) with built-in ECC
- Crypto Interface Block consisting of
  - 256-bit AES-GCM
  - SHA-3/384
  - 4096-bit RSA
- Key Management Unit
- Built-in DMA
- PCAP interface
- Supports ROM validation during pre-configuration stage
- Loads First Stage Boot Loader (FSBL) into OCM in either secure or non-secure boot modes
- Supports voltage, temperature, and frequency monitoring after configuration

Xilinx Peripheral Protection Unit (XPPU)

- Provides peripheral protection support
- Up to 20 masters simultaneously
- Multiple aperture sizes
- Access control for a specified set of address apertures on a per master basis
- 64KB peripheral apertures and controls access on per peripheral basis

I/O Peripherals

The IOP unit contains the data communication peripherals. Key features of the IOP include:

Triple-Speed Gigabit Ethernet

- Compatible with IEEE Std 802.3 and supports 10/100/1000Mb/s transfer rates (Full and Half duplex)
- Supports jumbo frames
- Built-in Scatter-Gather DMA capability
- Statistics counter registers for RMON/MIB
- Multiple I/O types (1.8, 2.5, 3.3V) on RGMII interface with external PHY
- GMII interface to PL to support interfaces as: TBI, SGMII, and RGMII v2.0 support
- Automatic pad and cyclic redundancy check (CRC) generation on transmitted frames
- Transmitter and Receive IP, TCP, and UDP checksum offload
- MDIO interface for physical layer management

- Full duplex flow control with recognition of incoming pause frames and hardware generation of transmitted pause frames
- 802.1Q VLAN tagging with recognition of incoming VLAN and priority tagged frames
- Supports IEEE Std 1588 v2

SD/SDIO 3.0 Controller

In addition to secure digital (SD) devices, this controller also supports eMMC 4.51.

- Host mode support only
- Built-in DMA
- 1/4-Bit SD Specification, version 3.0
- 1/4/8-Bit eMMC Specification, version 4.51
- Supports primary boot from SD Card and eMMC (Managed NAND)
- High speed, default speed, and low-speed support
- 1 and 4-bit data interface support
  - Low speed clock 0-400KHz
  - Default speed 0-25MHz
  - High speed clock 0-50MHz
- High speed Interface
  - SD UHS-1: 208MHz
  - eMMC HS200: 200MHz
- Memory, I/O, and SD cards
- Power control modes
- Data FIFO interface up to 512B

UART

- Programmable baud rate generator
- 6, 7, or 8 data bits
- 1, 1.5, or 2 stop bits
- Odd, even, space, mark, or no parity
- Parity, framing, and overrun error detection
- Line break generation and detection
- Automatic echo, local loopback, and remote loopback channel modes
- Modem control signals: CTS, RTS, DSR, DTR, RI, and DCD (from EMIO only)

- Sleep Mode with automatic wake-up
- Snoop Mode
- 16-bit timestamping for receive messages
- Both internal generated reference clock and external reference clock input from MIO
- Guarantee clock sampling edge between 80 to 83% at 24MHz reference clock input
- Optional eFUSE disable per port

USB 2.0

- Two USB controllers (configurable as USB 2.0 or USB 3.0)
- Host, device and On-The-Go (OTG) modes
- High Speed, Full Speed, and Low Speed
- Up to 12 endpoints
- 8-bit ULPI External PHY Interface
- The USB host controller registers and data structures are compliant to Intel xHCI specifications.
- 64-bit AXI master port with built-in DMA
- Power management features: hibernation mode

Static Memory Interfaces

The static memory interfaces support external static memories.

- ONFI 3.1 NAND flash support with up to 24-bit ECC
- 1-bit SPI, 2-bit SPI, 4-bit SPI (Quad-SPI), or two Quad-SPI (8-bit) serial NOR flash
- 8-bit eMMC interface supporting managed NAND flash

NAND ONFI 3.1 Flash Controller

- ONFI 3.1 compliant
- Supports chip select reduction per ONFI 3.1 spec
- SLC NAND for boot/configuration and data storage
- ECC options based on SLC NAND
    - 1, 4, or 8 bits per 512+spare bytes
    - 24 bits per 1024+spare bytes
- Maximum throughput as follows
    - Asynchronous mode (SDR) 24.3MB/s
    - Synchronous mode (NV-DDR) 112MB/s (for 100MHz flash clock)
- 8-bit SDR NAND interface

Interconnect

All the blocks are connected to each other and to the PL through a multi-layered ARM Advanced Microprocessor Bus Architecture (AMBA) AXI interconnect. The interconnect is non-blocking and supports multiple simultaneous master-slave transactions.

The interconnect is designed with latency sensitive masters, such as the ARM CPU, having the shortest paths to memory, and bandwidth critical masters, such as the potential PL masters, having high throughput connections to the slaves with which they need to communicate.

Traffic through the interconnect can be regulated through the Quality of Service (QoS) block in the interconnect. The QoS feature is used to regulate traffic generated by the CPU, DMA controller, and a combined entity representing the masters in the IOP.

PS Interfaces

PS interfaces include external interfaces going off-chip or signals going from PS to PL.

PS External Interfaces

The Zynq UltraScale+ MPSoC's external interfaces use dedicated pins that cannot be assigned as PL pins. These include:

- Clock, reset, boot mode, and voltage reference
- Up to 78 dedicated multiplexed I/O (MIO) pins, software-configurable to connect to any of the internal I/O peripherals and static memory controllers
- 32-bit or 64-bit DDR4/DDR3/DDR3L/LPDDR3 memories with optional ECC
- 32-bit LPDDR4 memory with optional ECC
- 4 channels (TX and RX pair) for transceivers

MIO Overview

The IOP peripherals communicate to external devices through a shared pool of up to 78 dedicated multiplexed I/O (MIO) pins. Each peripheral can be assigned one of several pre-defined groups of pins, enabling a flexible assignment of multiple devices simultaneously. Although 78 pins are not enough for simultaneous use of all the I/O peripherals, most IOP interface signals are available to the PL, allowing use of standard PL I/O pins when powered up and properly configured. Extended multiplexed I/O (EMIO) allows unmapped PS peripherals to access PL I/O.

Port mappings can appear in multiple locations. For example, there are up to 12 possible port mappings for CAN pins. The PS Configuration Wizard (PCW) tool aids in peripheral and static memory pin mapping.

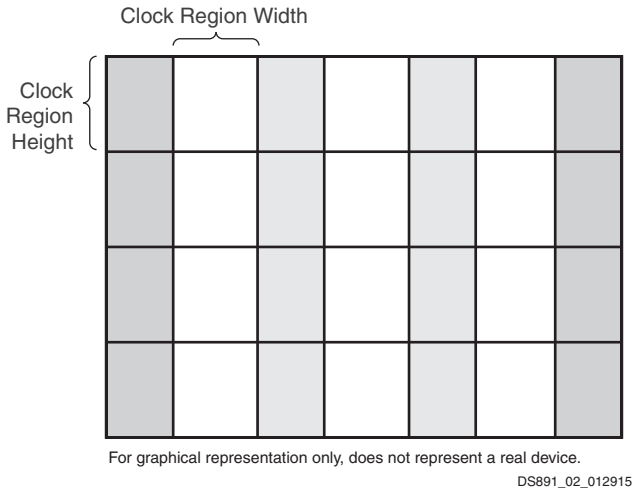

Figure 2: **Column-Based Device Divided into Clock Regions**

Input/Output

All Zynq UltraScale+ MPSoCs have I/O pins for communicating to external components. In addition, in the MPSoC's PS, there are another 78 I/Os that the I/O peripherals use to communicate to external components, referred to as multiplexed I/O (MIO). If more than 78 pins are required by the I/O peripherals, the I/O pins in the PL can be used to extend the MPSoC interfacing capability, referred to as extended MIO (EMIO).

The number of I/O pins in the PL of Zynq UltraScale+ MPSoCs varies depending on device and package. Each I/O is configurable and can comply with a large number of I/O standards. The I/Os are classed as high-performance (HP), or high-density (HD). The HP I/Os are optimized for highest performance operation, from 1.0V to 1.8V. The HD I/Os are reduced-feature I/Os organized in banks of 24, providing voltage support from 1.2V to 3.3V.

All I/O pins are organized in banks, with 52 HP pins per bank or 24 HD pins per bank. Each bank has one common V_{CCO} output buffer power supply, which also powers certain input buffers. Some single-ended input buffers require an internally generated or an externally applied reference voltage (V_{REF}). V_{REF} pins can be driven directly from the PCB or internally generated using the internal V_{REF} generator circuitry present in each bank.

I/O Electrical Characteristics

Single-ended outputs use a conventional CMOS push/pull output structure driving High towards V_{CCO} or Low towards ground, and can be put into a high-Z state. The system designer can specify the slew rate and the output strength. The input is always active but is usually ignored while the output is active. Each pin can optionally have a weak pull-up or a weak pull-down resistor.

Most signal pin pairs can be configured as differential input pairs or output pairs. Differential input pin pairs can optionally be terminated with a 100Ω internal resistor. All UltraScale architecture-based devices support differential standards beyond LVDS, including RSDS, BLVDS, differential SSTL, and differential HSTL. Each of the I/Os supports memory I/O standards, such as single-ended and differential HSTL as well as single-ended and differential SSTL. The Zynq UltraScale+ family includes support for MIPI with a dedicated D-PHY in the I/O bank.

Table 10: **Transceiver Information**

	Zynq UltraScale+ MPSoCs		
Type	PS-GTR	GTH	GTY
Qty	4	0–44	0–28
Max. Data Rate	6.0Gb/s	16.3Gb/s	32.75Gb/s
Min. Data Rate	1.25Gb/s	0.5Gb/s	0.5Gb/s
Applications	• PCIe Gen2 • USB • Ethernet	• Backplane • PCIe Gen4 • HMC	• 100G+ Optics • Chip-to-Chip • 25G+ Backplane • HMC

The following information in this section pertains to the GTH and GTY only.

The serial transmitter and receiver are independent circuits that use an advanced phase-locked loop (PLL) architecture to multiply the reference frequency input by certain programmable numbers between 4 and 25 to become the bit-serial data clock. Each transceiver has a large number of user-definable features and parameters. All of these can be defined during device configuration, and many can also be modified during operation.

Transmitter

The transmitter is fundamentally a parallel-to-serial converter with a conversion ratio of 16, 20, 32, 40, 64, or 80 for the GTH and 16, 20, 32, 40, 64, 80, 128, or 160 for the GTY. This allows the designer to trade off datapath width against timing margin in high-performance designs. These transmitter outputs drive the PC board with a single-channel differential output signal. TXOUTCLK is the appropriately divided serial data clock and can be used directly to register the parallel data coming from the internal logic. The incoming parallel data is fed through an optional FIFO and has additional hardware support for the 8B/10B, 64B/66B, or 64B/67B encoding schemes to provide a sufficient number of transitions. The bit-serial output signal drives two package pins with differential signals. This output signal pair has programmable signal swing as well as programmable pre- and post-emphasis to compensate for PC board losses and other interconnect characteristics. For shorter channels, the swing can be reduced to reduce power consumption.

Receiver

The receiver is fundamentally a serial-to-parallel converter, changing the incoming bit-serial differential signal into a parallel stream of words, each 16, 20, 32, 40, 64, or 80 bits in the GTH or 16, 20, 32, 40, 64, 80, 128, or 160 for the GTY. This allows the designer to trade off internal datapath width against logic timing margin. The receiver takes the incoming differential data stream, feeds it through programmable DC automatic gain control, linear and decision feedback equalizers (to compensate for PC board, cable, optical and other interconnect characteristics), and uses the reference clock input to initiate clock recognition. There is no need for a separate clock line. The data pattern uses non-return-to-zero (NRZ) encoding and optionally ensures sufficient data transitions by using the selected encoding scheme. Parallel data is then transferred into the device logic using the RXUSRCLK clock. For short channels, the transceivers offer a special low-power mode (LPM) to reduce power consumption by approximately 30%. The receiver DC automatic gain control and linear and decision feedback equalizers can optionally “auto-adapt” to automatically learn and compensate for different interconnect characteristics. This enables even more margin for tough 10G+ and 25G+ backplanes.

Programmable Data Width

Each port can be configured as 32K × 1; 16K × 2; 8K × 4; 4K × 9 (or 8); 2K × 18 (or 16); 1K × 36 (or 32); or 512 × 72 (or 64). Whether configured as block RAM or FIFO, the two ports can have different aspect ratios without any constraints. Each block RAM can be divided into two completely independent 18Kb block RAMs that can each be configured to any aspect ratio from 16K × 1 to 512 × 36. Everything described previously for the full 36Kb block RAM also applies to each of the smaller 18Kb block RAMs. Only in simple dual-port (SDP) mode can data widths of greater than 18 bits (18Kb RAM) or 36 bits (36Kb RAM) be accessed. In this mode, one port is dedicated to read operation, the other to write operation. In SDP mode, one side (read or write) can be variable, while the other is fixed to 32/36 or 64/72. Both sides of the dual-port 36Kb RAM can be of variable width.

Error Detection and Correction

Each 64-bit-wide block RAM can generate, store, and utilize eight additional Hamming code bits and perform single-bit error correction and double-bit error detection (ECC) during the read process. The ECC logic can also be used when writing to or reading from external 64- to 72-bit-wide memories.

FIFO Controller

Each block RAM can be configured as a 36Kb FIFO or an 18Kb FIFO. The built-in FIFO controller for single-clock (synchronous) or dual-clock (asynchronous or multirate) operation increments the internal addresses and provides four handshaking flags: full, empty, programmable full, and programmable empty. The programmable flags allow the user to specify the FIFO counter values that make these flags go active. The FIFO width and depth are programmable with support for different read port and write port widths on a single FIFO. A dedicated cascade path allows for easy creation of deeper FIFOs.

UltraRAM

UltraRAM is a high-density, dual-port, synchronous memory block used in some UltraScale+ families. Both of the ports share the same clock and can address all of the 4K x 72 bits. Each port can independently read from or write to the memory array. UltraRAM supports two types of write enable schemes. The first mode is consistent with the block RAM byte write enable mode. The second mode allows gating the data and parity byte writes separately. Multiple UltraRAM blocks can be cascaded together to create larger memory arrays. UltraRAM blocks can be connected together to create larger memory arrays. Dedicated routing in the UltraRAM column enables the entire column height to be connected together. This makes UltraRAM an ideal solution for replacing external memories such as SRAM. Cascadable anywhere from 288Kb to 36Mb, UltraRAM provides the flexibility to fulfill many different memory requirements.

Error Detection and Correction

Each 64-bit-wide UltraRAM can generate, store and utilize eight additional Hamming code bits and perform single-bit error correction and double-bit error detection (ECC) during the read process.

In FPGAs and the MPSoC PL, sensor outputs and up to 17 user-allocated external analog inputs are digitized using a 10-bit 200 kilo-sample-per-second (kSPS) ADC, and the measurements are stored in registers that can be accessed via internal FPGA (DRP), JTAG, PMBus, or I2C interfaces. The I2C interface and PMBus allow the on-chip monitoring to be easily accessed by the System Manager/Host before and after device configuration.

The System Monitor in the MPSoC PS uses a 10-bit, 1 mega-sample-per-second (MSPS) ADC to digitize the sensor inputs. The measurements are stored in registers and are accessed via the Advanced Peripheral Bus (APB) interface by the processors and the PMU in the PS.

Packaging

The UltraScale architecture-based devices are available in a variety of organic flip-chip and lidless flip-chip packages supporting different quantities of I/Os and transceivers. Maximum supported performance can depend on the style of package and its material. Always refer to the specific device data sheet for performance specifications by package type.

In flip-chip packages, the silicon device is attached to the package substrate using a high-performance flip-chip process. Decoupling capacitors are mounted on the package substrate to optimize signal integrity under simultaneous switching of outputs (SSO) conditions.

System-Level Features

Several functions span both the PS and PL and include:

- Reset Management
- Clock Management
- Power Domains
- PS Boot and Device Configuration
- Hardware and Software Debug Support

Reset Management

The reset management function provides the ability to reset the entire device or individual units within it. The PS supports these reset functions and signals:

- External and internal power-on reset signal
- Warm reset
- Watchdog timer reset
- User resets to PL
- Software, watchdog timer, or JTAG provided resets
- Security violation reset (locked down reset)

Clock Management

The PS in Zynq UltraScale+ MPSoCs is equipped with five phase-locked loops (PLLs), providing flexibility in configuring the clock domains within the PS. There are four primary clock domains of interest within the PS. These include the APU, the RPU, the DDR controller, and the I/O peripherals (IOP). The frequencies of all of these domains can be configured independently under software control.

Power Domains

The Zynq UltraScale+ MPSoC contains four separate power domains. When they are connected to separate power supplies, they can be completely powered down independently of each other without consuming any dynamic or static power. The processing system includes:

- Full Power Domain (FPD)
- Low Power Domain (LPD)
- Battery Powered Domain (BPD)

In addition to these three Processing System power domains, the PL can also be completely powered down if connected to separate power supplies.

The Full Power Domain (FPD) consists of the following major blocks:

- Application Processing Unit (APU)
- DMA (FP-DMA)
- Graphics Processing Unit (GPU)
- Dynamic Memory Controller (DDRC)
- High-Speed I/O Peripherals

The Low Power Domain (LPD) consists of the following major blocks:

- Real-Time Processing Unit (RPU)
- DMA (LP-DMA)
- Platform Management Unit (PMU)
- Configuration Security Unit (CSU)
- Low-Speed I/O Peripherals
- Static Memory Interfaces

The Battery Power Domain (BPD) is the lowest power domain of the Zynq UltraScale+ MPSoC processing system. In this mode, all the PS is powered off except the Real-Time Clock (RTC) and battery-backed RAM (BBRAM).

Power Examples

Power for the Zynq UltraScale+ MPSoCs varies depending on the utilization of the PL resources, and the frequency of the PS and PL. To estimate power, use the Xilinx Power Estimator (XPE) at:

http://www.xilinx.com/products/design_tools/logic_design/xpe.htm

Revision History

The following table shows the revision history for this document:

Date	Version	Description of Revisions
02/15/2017	1.4	Updated DSP count in Table 1, Table 3, and Table 5. Updated I/O Electrical Characteristics. Updated Table 12 with -2E speed grade.
09/23/2016	1.3	Updated Table 2; Table 3; Table 4; Table 6; Graphics Processing Unit (GPU); and NAND ONFI 3.1 Flash Controller.
06/03/2016	1.2	Added CG devices: Updated Table 1; Table 2; Table 3; Table 4; Table 5; Table 6; and Table 12. Added Video Encoder/Decoder (VCU); Table 7; and Power Examples (removed XPE Computed Range table). Updated: General Description; ARM Cortex-A53 Based Application Processing Unit (APU); Zynq UltraScale+ MPSoCs; Dynamic Memory Controller (DDRC); and Figure 3.
01/28/2016	1.1	Updated Table 1 and Table 2.
11/24/2015	1.0	Initial Xilinx release.
