
Welcome to E-XFL.COM

Embedded - System On Chip (SoC): The Heart of Modern Embedded Systems

Embedded - System On Chip (SoC) refers to an integrated circuit that consolidates all the essential components of a computer system into a single chip. This includes a microprocessor, memory, and other peripherals, all packed into one compact and efficient package. SoCs are designed to provide a complete computing solution, optimizing both space and power consumption, making them ideal for a wide range of embedded applications.

What are Embedded - System On Chip (SoC)?

System On Chip (SoC) integrates multiple functions of a computer or electronic system onto a single chip. Unlike traditional multi-chip solutions, SoCs combine a central

Details	
Product Status	Active
Architecture	MCU, FPGA
Core Processor	Quad ARM® Cortex®-A53 MPCore™ with CoreSight™, Dual ARM®Cortex™-R5 with CoreSight™, ARM Mali™-400 MP2
Flash Size	-
RAM Size	256KB
Peripherals	DMA, WDT
Connectivity	CANbus, EBI/EMI, Ethernet, I²C, MMC/SD/SDIO, SPI, UART/USART, USB OTG
Speed	533MHz, 600MHz, 1.3GHz
Primary Attributes	Zynq®UltraScale+™ FPGA, 154K+ Logic Cells
Operating Temperature	0°C ~ 100°C (TJ)
Package / Case	484-BFBGA, FCBGA
Supplier Device Package	484-FCBGA (19x19)
Purchase URL	https://www.e-xfl.com/product-detail/xilinx/xczu3eg-2sbva484e

ARM Mali-400 Based GPU

- Supports OpenGL ES 1.1 and 2.0
- Supports OpenVG 1.1
- GPU frequency: Up to 667MHz
- Single Geometry Processor, Two Pixel Processors
- Pixel Fill Rate: 2 Mpixels/sec/MHz
- Triangle Rate: 0.11 Mtriangles/sec/MHz
- 64KB L2 Cache
- Power island gating

External Memory Interfaces

- Multi-protocol dynamic memory controller
- 32-bit or 64-bit interfaces to DDR4, DDR3, DDR3L, or LPDDR3 memories, and 32-bit interface to LPDDR4 memory
- ECC support in 64-bit and 32-bit modes
- Up to 32GB of address space using single or dual rank of 8-, 16-, or 32-bit-wide memories
- Static memory interfaces
  - eMMC4.51 Managed NAND flash support
  - ONFI3.1 NAND flash with 24-bit ECC
  - 1-bit SPI, 2-bit SPI, 4-bit SPI (Quad-SPI), or two Quad-SPI (8-bit) serial NOR flash

8-Channel DMA Controller

- Two DMA controllers of 8-channels each
- Memory-to-memory, memory-to-peripheral, peripheral-to-memory, and scatter-gather transaction support

Serial Transceivers

- Four dedicated PS-GTR receivers and transmitters supports up to 6.0Gb/s data rates
  - Supports SGMII tri-speed Ethernet, PCI Express® Gen2, Serial-ATA (SATA), USB3.0, and DisplayPort

Dedicated I/O Peripherals and Interfaces

- PCI Express — Compliant with PCIe® 2.1 base specification
  - Root complex and End Point configurations
  - x1, x2, and x4 at Gen1 or Gen2 rates
- SATA Host
  - 1.5, 3.0, and 6.0Gb/s data rates as defined by SATA Specification, revision 3.1
  - Supports up to two channels
- DisplayPort Controller
  - Up to 5.4Gb/s rate
  - Up to two TX lanes (no RX support)
- Four 10/100/1000 tri-speed Ethernet MAC peripherals with IEEE Std 802.3 and IEEE Std 1588 revision 2.0 support
  - Scatter-gather DMA capability
  - Recognition of IEEE Std 1588 rev.2 PTP frames
  - GMII, RGMII, and SGMII interfaces
  - Jumbo frames
- Two USB 3.0/2.0 Device, Host, or OTG peripherals, each supporting up to 12 endpoints
  - USB 3.0/2.0 compliant device IP core
  - Super-speed, high- speed, full-speed, and low-speed modes
  - Intel XHCI- compliant USB host
- Two full CAN 2.0B-compliant CAN bus interfaces
  - CAN 2.0-A and CAN 2.0-B and ISO 118981-1 standard compliant
- Two SD/SDIO 2.0/eMMC4.51 compliant controllers
- Two full-duplex SPI ports with three peripheral chip selects
- Two high-speed UARTs (up to 1Mb/s)
- Two master and slave I2C interfaces
- Up to 78 flexible multiplexed I/O (MIO) (up to three banks of 26 I/Os) for peripheral pin assignment
- Up to 96 EMIOs (up to three banks of 32 I/Os) connected to the PL

Interconnect

- High-bandwidth connectivity within PS and between PS and PL
- ARM AMBA® AXI4-based
- QoS support for latency and bandwidth control
- Cache Coherent Interconnect (CCI)

System Memory Management

- System Memory Management Unit (SMMU)
- Xilinx Memory Protection Unit (XMPU)

Platform Management Unit

- Power gates PS peripherals, power islands, and power domains
- Clock gates PS peripheral user firmware option

Configuration and Security Unit

- Boots PS and configures PL
- Supports secure and non-secure boot modes

System Monitor in PS

- On-chip voltage and temperature sensing

Feature Summary

Table 1: **Zynq UltraScale+ MPSoC: CG Device Feature Summary**

	ZU2CG	ZU3CG	ZU4CG	ZU5CG	ZU6CG	ZU7CG	ZU9CG
Application Processing Unit	Dual-core ARM Cortex-A53 MPCore with CoreSight; NEON & Single/Double Precision Floating Point; 32KB/32KB L1 Cache, 1MB L2 Cache						
Real-Time Processing Unit	Dual-core ARM Cortex-R5 with CoreSight; Single/Double Precision Floating Point; 32KB/32KB L1 Cache, and TCM						
Embedded and External Memory	256KB On-Chip Memory w/ECC; External DDR4; DDR3; DDR3L; LPDDR4; LPDDR3; External Quad-SPI; NAND; eMMC						
General Connectivity	214 PS I/O; UART; CAN; USB 2.0; I2C; SPI; 32b GPIO; Real Time Clock; WatchDog Timers; Triple Timer Counters						
High-Speed Connectivity	4 PS-GTR; PCIe Gen1/2; Serial ATA 3.1; DisplayPort 1.2a; USB 3.0; SGMII						
System Logic Cells	103,320	154,350	192,150	256,200	469,446	504,000	599,550
CLB Flip-Flops	94,464	141,120	175,680	234,240	429,208	460,800	548,160
CLB LUTs	47,232	70,560	87,840	117,120	214,604	230,400	274,080
Distributed RAM (Mb)	1.2	1.8	2.6	3.5	6.9	6.2	8.8
Block RAM Blocks	150	216	128	144	714	312	912
Block RAM (Mb)	5.3	7.6	4.5	5.1	25.1	11.0	32.1

FFVC900	31x31					48, 156 16, 0		48, 156 16, 0
FFVB1156	35x35					120, 208 24, 0		120, 208 24, 0
FFVC1156	35x35						48, 312 20, 0	
FFVF1517	40x40						48, 416 24, 0	

Notes:

1. Go to Ordering Information for package designation details.
2. FB/FF packages have 1.0mm ball pitch. SB/SF packages have 0.8mm ball pitch.
3. All device package combinations bond out 4 PS-GTR transceivers.
4. All device package combinations bond out 214 PS I/O except ZU2CG and ZU3CG in the SBVA484 and SFVA625 packages, which bond out 170 PS I/Os.
5. Packages with the same last letter and number sequence, e.g., A484, are footprint compatible with all other UltraScale devices with the same sequence. The footprint compatible devices within this family are outlined.
6. All 58 HP I/O pins are powered by the same V_{CCO} supply.
7. GTH transceivers in the SFVC784 package support data rates up to 12.5Gb/s.

3. GTH transceivers in the SFVC784 package support data rates up to 12.5Gb/s. See Table 6.

Zynq UltraScale+ MPSoCs

A comprehensive device family, Zynq UltraScale+ MPSoCs offer single-chip, all programmable, heterogeneous multiprocessors that provide designers with software, hardware, interconnect, power, security, and I/O programmability. The range of devices in the Zynq UltraScale+ MPSoC family allows designers to target cost-sensitive as well as high-performance applications from a single platform using industry-standard tools. While each Zynq UltraScale+ MPSoC contains the same PS, the PL, Video hard blocks, and I/O resources vary between the devices.

Table 7: **Zynq UltraScale+ MPSoC Device Features**

	CG Devices	EG Devices	EV Devices
APU	Dual-core ARM Cortex-A53	Quad-core ARM Cortex-A53	Quad-core ARM Cortex-A53
RPU	Dual-core ARM Cortex-R5	Dual-core ARM Cortex-R5	Dual-core ARM Cortex-R5
GPU	–	Mali-400MP2	Mali-400MP2
VCU	–	–	H.264/H.265

The Zynq UltraScale+ MPSoCs are able to serve a wide range of applications including:

- Automotive: Driver assistance, driver information, and infotainment
- Wireless Communications: Support for multiple spectral bands and smart antennas
- Wired Communications: Multiple wired communications standards and context-aware network services
- Data Centers: Software Defined Networks (SDN), data pre-processing, and analytics
- Smarter Vision: Evolving video-processing algorithms, object detection, and analytics
- Connected Control/M2M: Flexible/adaptable manufacturing, factory throughput, quality, and safety

The UltraScale MPSoC architecture provides processor scalability from 32 to 64 bits with support for virtualization, the combination of soft and hard engines for real-time control, graphics/video processing, waveform and packet processing, next-generation interconnect and memory, advanced power management, and technology enhancements that deliver multi-level security, safety, and reliability. Xilinx offers a large number of soft IP for the Zynq UltraScale+ MPSoC family. Stand-alone and Linux device drivers are available for the peripherals in the PS and the PL. Xilinx's Vivado® Design Suite, SDK™, and PetaLinux development environments enable rapid product development for software, hardware, and systems engineers. The ARM-based PS also brings a broad range of third-party tools and IP providers in combination with Xilinx's existing PL ecosystem.

The Zynq UltraScale+ MPSoC family delivers unprecedented processing, I/O, and memory bandwidth in the form of an optimized mix of heterogeneous processing engines embedded in a next-generation, high-performance, on-chip interconnect with appropriate on-chip memory subsystems. The heterogeneous processing and programmable engines, which are optimized for different application tasks, enable the Zynq UltraScale+ MPSoCs to deliver the extensive performance and efficiency required to address next-generation smarter systems while retaining backwards compatibility with the original Zynq-7000 All Programmable SoC family. The UltraScale MPSoC architecture also incorporates multiple levels of security, increased safety, and advanced power management, which are critical requirements of next-generation smarter systems. Xilinx's embedded UltraFast™ design methodology fully exploits the

ASIC-class capabilities afforded by the UltraScale MPSoC architecture while supporting rapid system development.

The inclusion of an application processor enables high-level operating system support, e.g., Linux. Other standard operating systems used with the Cortex-A53 processor are also available for the Zynq UltraScale+ MPSoC family. The PS and the PL are on separate power domains, enabling users to power down the PL for power management if required. The processors in the PS always boot first, allowing a software centric approach for PL configuration. PL configuration is managed by software running on the CPU, so it boots similar to an ASSP.

Processing System

Application Processing Unit (APU)

The key features of the APU include:

- 64-bit quad-core ARM Cortex-A53 MPCores. Features associated with each core include:
  - ARM v8-A Architecture
  - Operating target frequency: up to 1.5GHz
  - Single and double precision floating point:
    4 SP / 2 DP FLOPs
  - NEON Advanced SIMD support with single and double precision floating point instructions
  - A64 instruction set in 64-bit operating mode, A32/T32 instruction set in 32-bit operating mode
  - Level 1 cache (separate instruction and data, 32KB each for each Cortex-A53 CPU)
    - 2-way set-associative Instruction Cache with parity support
    - 4-way set-associative Data Cache with ECC support
  - Integrated memory management unit (MMU) per processor core
  - TrustZone for secure mode operation
  - Virtualization support
- Ability to operate in single processor, symmetric quad processor, and asymmetric quad-processor modes
- Integrated 16-way set-associative 1MB Unified Level 2 cache with ECC support
- Interrupts and Timers
  - Generic interrupt controller (GIC-400)
  - ARM generic timers (4 timers per CPU)
  - One watchdog timer (WDT)
  - One global timer
  - Two triple timers/counters (TTC)
- Little and big endian support
  - Big endian support in BE8 mode
- CoreSight debug and trace support
  - Embedded Trace Macrocell (ETM) for instruction trace
  - Cross trigger interface (CTI) enabling hardware breakpoints and triggers
- ACP interface to PL for I/O coherency and Level 2 cache allocation
- ACE interface to PL for full coherency
- Power island gating on each processor core
- Optional eFUSE disable per core

Real-Time Processing Unit (RPU)

- Dual-core ARM Cortex-R5 MPCores. Features associated with each core include:
  - ARM v7-R Architecture (32-bit)
  - Operating target frequency: Up to 600MHz
  - A32/T32 instruction set support
  - 4-way set-associative Level 1 caches (separate instruction and data, 32KB each) with ECC support
  - Integrated Memory Protection Unit (MPU) per processor
  - 128KB Tightly Coupled Memory (TCM) with ECC support
  - TCMs can be combined to become 256KB in lockstep mode
- Ability to operate in single-processor or dual-processor modes (split and lock-step)
- Little and big endian support
- Dedicated SWDT and two Triple Timer Counters (TTC)
- CoreSight debug and trace support
  - Embedded Trace Macrocell (ETM) for instruction and trace
  - Cross trigger interface (CTI) enabling hardware breakpoints and triggers
- Optional eFUSE disable

Full-Power Domain DMA (FPD-DMA) and Low-Power Domain DMA (LPD-DMA)

- Two general-purpose DMA controllers one in the full-power domain (FPD-DMA) and one in the low-power domain (LPD-DMA)
- Eight independent channels per DMA
- Multiple transfer types:
  - Memory-to-memory
  - Memory-to-peripheral
  - Peripheral-to-memory and
  - Scatter-gather
- 8 peripheral interfaces per DMA
- TrustZone per DMA for optional secure operation

- Audio support
  - A single stream carries up to 8 LPCM channels at 192kHz with 24-bit resolution
  - Supports compressed formats including DRA, Dolby MAT, and DTS HD
  - Multi-Stream Transport can extend the number of audio channels
  - Audio copy protection
  - 2-channel streaming or input from the PL
  - Multi-channel non-streaming audio from a memory audio frame buffer
- Includes a System Time Clock (STC) compliant with ISO/IEC 13818-1
- Boot-time display using minimum resources

Platform Management Unit (PMU)

- Performs system initialization during boot
- Acts as a delegate to the application and real-time processors during sleep state
- Initiates power-up and restart after the wake-up request
- Maintains the system power state at all time
- Manages the sequence of low-level events required for power-up, power-down, reset, clock gating, and power gating of islands and domains
- Provides error management (error handling and reporting)
- Provides safety check functions (e.g., memory scrubbing)

The PMU includes the following blocks:

- Platform management processor
- Fixed ROM for boot-up of the device
- 128KB RAM with ECC for optional user/firmware code
- Local and global registers to manage power-down, power-up, reset, clock gating, and power gating requests
- Interrupt controller with 16 interrupts from other modules and the inter-processor communication interface (IPI)
- GPI and GPO interfaces to and from PS I/O and PL
- JTAG interface for PMU debug
- Optional User-Defined Firmware

SPI

- Full-duplex operation offers simultaneous receive and transmit
- 128B deep read and write FIFO
- Master or slave SPI mode
- Up to 3 chip select lines
- Multi-master environment
- Identifies an error condition if more than one master detected
- Selectable master clock reference
- Software can poll for status or be interrupt driven

I2C

- 128-bit buffer size
- Both normal (100kHz) and fast bus data rates (400kHz)
- Master or slave mode
- Normal or extended addressing
- I2C bus hold for slow host service

GPIO

- Up to 128 GPIO bits
  - Up to 78-bits from MIO and 96-bits from EMIO
- Each GPIO bit can be dynamically programmed as input or output
- Independent reset values for each bit of all registers
- Interrupt request generation for each GPIO signals
- Single Channel (Bit) write capability for all control registers include data output register, direction control register, and interrupt clear register
- Read back in output mode

CAN

- Conforms to the ISO 11898 -1, CAN2.0A, and CAN 2.0B standards
- Both standard (11-bit identifier) and extended (29-bit identifier) frames
- Bit rates up to 1Mb/s
- Transmit and Receive message FIFO with a depth of 64 messages
- Watermark interrupts for TXFIFO and RXFIFO
- Automatic re-transmission on errors or arbitration loss in normal mode
- Acceptance filtering of 4 acceptance filters

- 2 chip selects
- Programmable access timing
- 1.8V and 3.3V I/O
- Built-in DMA for improved performance

Quad-SPI Controller

- 4 bytes (32-bit) and 3 bytes (24-bit) address width
- Maximum SPI Clock at Master Mode at 150MHz
- Single, Dual-Parallel, and Dual-Stacked mode
- 32-bit AXI Linear Address Mapping Interface for read operation
- Up to 2 chip select signals
- Write Protection Signal
- Hold signals
- 4-bit bidirectional I/O signals
- x1/x2/x4 Read speed required
- x1 write speed required only
- 64 byte Entry FIFO depth to improve QSPI read efficiency
- Built-in DMA for improved performance

Video Encoder/Decoder (VCU)

Zynq UltraScale+ MPSoCs include a Video codec (encoder/decoder) available in the devices designated with the EV suffix. The VCU is located in the PL and can be accessed from either the PL or PS.

- Simultaneous Encode and Decode through separate cores
- H.264 high profile level 5.2 (4Kx2K-60)
- H.265 (HEVC) main, main10 profile, level 5.1, high Tier, up to 4Kx2K-60 rate
- 8 and 10 bit encoding
- 4:2:0 and 4:2:2 chroma sampling
- 8Kx4K-15 rate
- Multi-stream up to total of 4Kx2K-60 rate
- Low Latency mode
- Can share the PS DRAM or use dedicated DRAM in the PL
- Clock/power management
- OpenMax Linux drivers

Table 8: **MIO Peripheral Interface Mapping**

Peripheral Interface	MIO	EMIO
Quad-SPI NAND	Yes	No
USB2.0: 0,1	Yes: External PHY	No
SDIO 0,1	Yes	Yes
SPI: 0,1 I2C: 0,1 CAN: 0,1 GPIO	Yes CAN: External PHY GPIO: Up to 78 bits	Yes CAN: External PHY GPIO: Up to 96 bits
GigE: 0,1,2,3	RGMII v2.0: External PHY	Supports GMII, RGMII v2.0 (HSTL), RGMII v1.3, MII, SGMII, and 1000BASE-X in Programmable Logic
UART: 0,1	Simple UART: Only two pins (TX and RX)	Full UART (TX, RX, DTR, DCD, DSR, RI, RTS, and CTS) requires either: • Two Processing System (PS) pins (RX and TX) through MIO and six additional Programmable Logic (PL) pins, *or* • Eight Programmable Logic (PL) pins
Debug Trace Ports	Yes: Up to 16 trace bits	Yes: Up to 32 trace bits
Processor JTAG	Yes	Yes

Transceiver (PS-GTR)

The four PS-GTR transceivers, which reside in the full power domain (FPD), support data rates of up to 6.0Gb/s. All the protocols cannot be pinned out at the same time. At any given time, four differential pairs can be pinned out using the transceivers. This is user programmable via the high-speed I/O multiplexer (HS-MIO).

- A Quad transceiver PS-GTR (TX/RX pair) able to support following standards simultaneously
  - x1, x2, or x4 lane of PCIe at Gen1 (2.5Gb/s) or Gen2 (5.0Gb/s) rates
  - 1 or 2 lanes of DisplayPort (TX only) at 1.62Gb/s, 2.7Gb/s, or 5.4Gb/s
  - 1 or 2 SATA channels at 1.5Gb/s, 3.0Gb/s, or 6.0Gb/s
  - 1 or 2 USB3.0 channels at 5.0Gb/s
  - 1-4 Ethernet SGMII channels at 1.25Gb/s
- Provides flexible host-programmable multiplexing function for connecting the transceiver resources to the PS masters (DisplayPort, PCIe, Serial-ATA, USB3.0, and GigE).

High-Performance AXI Ports

The high-performance AXI4 ports provide access from the PL to DDR and high-speed interconnect in the PS. The six dedicated AXI memory ports from the PL to the PS are configurable as either 128-bit, 64-bit, or 32-bit interfaces. These interfaces connect the PL to the memory interconnect via a FIFO interface. Two of the AXI interfaces support I/O coherent access to the APU caches.

Each high-performance AXI port has these characteristics:

- Reduced latency between PL and processing system memory
- 1KB deep FIFO
- Configurable either as 128-bit, 64-bit, or 32-bit AXI interfaces
- Multiple AXI command issuing to DDR

Accelerator Coherency Port (ACP)

The Zynq UltraScale+ MPSoC accelerator coherency port (ACP) is a 64-bit AXI slave interface that provides connectivity between the APU and a potential accelerator function in the PL. The ACP directly connects the PL to the snoop control unit (SCU) of the ARM Cortex-A53 processors, enabling cache-coherent access to CPU data in the L2 cache. The ACP provides a low latency path between the PS and a PL-based accelerator when compared with a legacy cache flushing and loading scheme. The ACP only snoops access in the CPU L2 cache, providing coherency in hardware. It does not support coherency on the PL side. So this interface is ideal for a DMA or an accelerator in the PL that only requires coherency on the CPU cache memories. For example, if a MicroBlaze™ processor in the PL is attached to the ACP interface, the cache of MicroBlaze processor will not be coherent with Cortex-A53 caches.

AXI Coherency Extension (ACE)

The Zynq UltraScale+ MPSoC AXI coherency extension (ACE) is a 64-bit AXI4 slave interface that provides connectivity between the APU and a potential accelerator function in the PL. The ACE directly connects the PL to the snoop control unit (SCU) of the ARM Cortex-A53 processors, enabling cache-coherent access to Cache Coherent Interconnect (CCI). The ACE provides a low-latency path between the PS and a PL-based accelerator when compared with a legacy cache flushing and loading scheme. The ACE snoops accesses to the CCI and the PL side, thus, providing full coherency in hardware. This interface can be used to hook up a cached interface in the PL to the PS as caches on both the Cortex-A53 memories and the PL master are snooped thus providing full coherency. For example, if a MicroBlaze processor in the PL is hooked up using an ACE interface, then Cortex-A53 and MicroBlaze processor caches will be coherent with each other.

Table 10: **Transceiver Information**

	Zynq UltraScale+ MPSoCs		
Type	PS-GTR	GTH	GTY
Qty	4	0–44	0–28
Max. Data Rate	6.0Gb/s	16.3Gb/s	32.75Gb/s
Min. Data Rate	1.25Gb/s	0.5Gb/s	0.5Gb/s
Applications	• PCIe Gen2 • USB • Ethernet	• Backplane • PCIe Gen4 • HMC	• 100G+ Optics • Chip-to-Chip • 25G+ Backplane • HMC

The following information in this section pertains to the GTH and GTY only.

The serial transmitter and receiver are independent circuits that use an advanced phase-locked loop (PLL) architecture to multiply the reference frequency input by certain programmable numbers between 4 and 25 to become the bit-serial data clock. Each transceiver has a large number of user-definable features and parameters. All of these can be defined during device configuration, and many can also be modified during operation.

Transmitter

The transmitter is fundamentally a parallel-to-serial converter with a conversion ratio of 16, 20, 32, 40, 64, or 80 for the GTH and 16, 20, 32, 40, 64, 80, 128, or 160 for the GTY. This allows the designer to trade off datapath width against timing margin in high-performance designs. These transmitter outputs drive the PC board with a single-channel differential output signal. TXOUTCLK is the appropriately divided serial data clock and can be used directly to register the parallel data coming from the internal logic. The incoming parallel data is fed through an optional FIFO and has additional hardware support for the 8B/10B, 64B/66B, or 64B/67B encoding schemes to provide a sufficient number of transitions. The bit-serial output signal drives two package pins with differential signals. This output signal pair has programmable signal swing as well as programmable pre- and post-emphasis to compensate for PC board losses and other interconnect characteristics. For shorter channels, the swing can be reduced to reduce power consumption.

Receiver

The receiver is fundamentally a serial-to-parallel converter, changing the incoming bit-serial differential signal into a parallel stream of words, each 16, 20, 32, 40, 64, or 80 bits in the GTH or 16, 20, 32, 40, 64, 80, 128, or 160 for the GTY. This allows the designer to trade off internal datapath width against logic timing margin. The receiver takes the incoming differential data stream, feeds it through programmable DC automatic gain control, linear and decision feedback equalizers (to compensate for PC board, cable, optical and other interconnect characteristics), and uses the reference clock input to initiate clock recognition. There is no need for a separate clock line. The data pattern uses non-return-to-zero (NRZ) encoding and optionally ensures sufficient data transitions by using the selected encoding scheme. Parallel data is then transferred into the device logic using the RXUSRCLK clock. For short channels, the transceivers offer a special low-power mode (LPM) to reduce power consumption by approximately 30%. The receiver DC automatic gain control and linear and decision feedback equalizers can optionally “auto-adapt” to automatically learn and compensate for different interconnect characteristics. This enables even more margin for tough 10G+ and 25G+ backplanes.

Integrated Block for 100G Ethernet

Compliant to the IEEE Std 802.3ba, the 100G Ethernet integrated blocks in the UltraScale architecture provide low latency 100Gb/s Ethernet ports with a wide range of user customization and statistics gathering. With support for 10 x 10.3125Gb/s (CAUI) and 4 x 25.78125Gb/s (CAUI-4) configurations, the integrated block includes both the 100G MAC and PCS logic with support for IEEE Std 1588v2 1-step and 2-step hardware timestamping.

In UltraScale+ devices, the 100G Ethernet blocks contain a Reed Solomon Forward Error Correction (RS-FEC) block, compliant to IEEE Std 802.3bj, that can be used with the Ethernet block or stand alone in user applications. These families also support OTN mapping mode in which the PCS can be operate without using the MAC.

Clock Management

The clock generation and distribution components in UltraScale architecture-based devices are located adjacent to the columns that contain the memory interfacing and input and output circuitry. This tight coupling of clocking and I/O provides low-latency clocking to the I/O for memory interfaces and other I/O protocols. Within every clock management tile (CMT) resides one mixed-mode clock manager (MMCM), two PLLs, clock distribution buffers and routing, and dedicated circuitry for implementing external memory interfaces.

Mixed-Mode Clock Manager

The mixed-mode clock manager (MMCM) can serve as a frequency synthesizer for a wide range of frequencies and as a jitter filter for incoming clocks. At the center of the MMCM is a voltage-controlled oscillator (VCO), which speeds up and slows down depending on the input voltage it receives from the phase frequency detector (PFD).

Three sets of programmable frequency dividers (D, M, and O) are programmable by configuration and during normal operation via the Dynamic Reconfiguration Port (DRP). The pre-divider D reduces the input frequency and feeds one input of the phase/frequency comparator. The feedback divider M acts as a multiplier because it divides the VCO output frequency before feeding the other input of the phase comparator. D and M must be chosen appropriately to keep the VCO within its specified frequency range. The VCO has eight equally-spaced output phases (0°, 45°, 90°, 135°, 180°, 225°, 270°, and 315°). Each phase can be selected to drive one of the output dividers, and each divider is programmable by configuration to divide by any integer from 1 to 128.

The MMCM has three input-jitter filter options: low bandwidth, high bandwidth, or optimized mode. Low-Bandwidth mode has the best jitter attenuation. High-Bandwidth mode has the best phase offset. Optimized mode allows the tools to find the best setting.

The MMCM can have a fractional counter in either the feedback path (acting as a multiplier) or in one output path. Fractional counters allow non-integer increments of 1/8 and can thus increase frequency synthesis capabilities by a factor of 8. The MMCM can also provide fixed or dynamic phase shift in small increments that depend on the VCO frequency. At 1,600MHz, the phase-shift timing increment is 11.2ps.

Programmable Data Width

Each port can be configured as 32K × 1; 16K × 2; 8K × 4; 4K × 9 (or 8); 2K × 18 (or 16); 1K × 36 (or 32); or 512 × 72 (or 64). Whether configured as block RAM or FIFO, the two ports can have different aspect ratios without any constraints. Each block RAM can be divided into two completely independent 18Kb block RAMs that can each be configured to any aspect ratio from 16K × 1 to 512 × 36. Everything described previously for the full 36Kb block RAM also applies to each of the smaller 18Kb block RAMs. Only in simple dual-port (SDP) mode can data widths of greater than 18 bits (18Kb RAM) or 36 bits (36Kb RAM) be accessed. In this mode, one port is dedicated to read operation, the other to write operation. In SDP mode, one side (read or write) can be variable, while the other is fixed to 32/36 or 64/72. Both sides of the dual-port 36Kb RAM can be of variable width.

Error Detection and Correction

Each 64-bit-wide block RAM can generate, store, and utilize eight additional Hamming code bits and perform single-bit error correction and double-bit error detection (ECC) during the read process. The ECC logic can also be used when writing to or reading from external 64- to 72-bit-wide memories.

FIFO Controller

Each block RAM can be configured as a 36Kb FIFO or an 18Kb FIFO. The built-in FIFO controller for single-clock (synchronous) or dual-clock (asynchronous or multirate) operation increments the internal addresses and provides four handshaking flags: full, empty, programmable full, and programmable empty. The programmable flags allow the user to specify the FIFO counter values that make these flags go active. The FIFO width and depth are programmable with support for different read port and write port widths on a single FIFO. A dedicated cascade path allows for easy creation of deeper FIFOs.

UltraRAM

UltraRAM is a high-density, dual-port, synchronous memory block used in some UltraScale+ families. Both of the ports share the same clock and can address all of the 4K x 72 bits. Each port can independently read from or write to the memory array. UltraRAM supports two types of write enable schemes. The first mode is consistent with the block RAM byte write enable mode. The second mode allows gating the data and parity byte writes separately. Multiple UltraRAM blocks can be cascaded together to create larger memory arrays. UltraRAM blocks can be connected together to create larger memory arrays. Dedicated routing in the UltraRAM column enables the entire column height to be connected together. This makes UltraRAM an ideal solution for replacing external memories such as SRAM. Cascadable anywhere from 288Kb to 36Mb, UltraRAM provides the flexibility to fulfill many different memory requirements.

Error Detection and Correction

Each 64-bit-wide UltraRAM can generate, store and utilize eight additional Hamming code bits and perform single-bit error correction and double-bit error detection (ECC) during the read process.

In FPGAs and the MPSoC PL, sensor outputs and up to 17 user-allocated external analog inputs are digitized using a 10-bit 200 kilo-sample-per-second (kSPS) ADC, and the measurements are stored in registers that can be accessed via internal FPGA (DRP), JTAG, PMBus, or I2C interfaces. The I2C interface and PMBus allow the on-chip monitoring to be easily accessed by the System Manager/Host before and after device configuration.

The System Monitor in the MPSoC PS uses a 10-bit, 1 mega-sample-per-second (MSPS) ADC to digitize the sensor inputs. The measurements are stored in registers and are accessed via the Advanced Peripheral Bus (APB) interface by the processors and the PMU in the PS.

Packaging

The UltraScale architecture-based devices are available in a variety of organic flip-chip and lidless flip-chip packages supporting different quantities of I/Os and transceivers. Maximum supported performance can depend on the style of package and its material. Always refer to the specific device data sheet for performance specifications by package type.

In flip-chip packages, the silicon device is attached to the package substrate using a high-performance flip-chip process. Decoupling capacitors are mounted on the package substrate to optimize signal integrity under simultaneous switching of outputs (SSO) conditions.

System-Level Features

Several functions span both the PS and PL and include:

- Reset Management
- Clock Management
- Power Domains
- PS Boot and Device Configuration
- Hardware and Software Debug Support

Reset Management

The reset management function provides the ability to reset the entire device or individual units within it. The PS supports these reset functions and signals:

- External and internal power-on reset signal
- Warm reset
- Watchdog timer reset
- User resets to PL
- Software, watchdog timer, or JTAG provided resets
- Security violation reset (locked down reset)

Ordering Information

Table 12 shows the speed and temperature grades available in the different device families.

Table 12: **Speed Grade and Temperature Grade**

Device Family	Devices	Speed Grade and Temperature Grade			
		Commercial (C)	Extended (E)		Industrial (I)
		0°C to +85°C	0°C to +100°C	0°C to +110°C	–40°C to +100°C
Zynq UltraScale+	CG Devices		-2E (0.85V)		-2I (0.85V)
				-2LE(1)(2) (0.85V or 0.72V)	
			-1E (0.85V)		-1I (0.85V)
					-1LI(2) (0.85V or 0.72V)
	ZU2EG ZU3EG		-2E (0.85V)		-2I (0.85V)
				-2LE(1)(2) (0.85V or 0.72V)	
			-1E (0.85V)		-1I (0.85V)
					-1LI(2) (0.85V or 0.72V)
	ZU4EG ZU5EG ZU6EG ZU7EG ZU9EG ZU11EG ZU15EG ZU17EG ZU19EG		-3E (0.90V)		
			-2E (0.85V)		-2I (0.85V)
				-2LE(1)(2) (0.85V or 0.72V)	
			-1E (0.85V)		-1I (0.85V)
					-1LI(2) (0.85V or 0.72V)
	EV Devices		-3E (0.90V)		
			-2E (0.85V)		-2I (0.85V)
				-2LE(1)(2) (0.85V or 0.72V)	
			-1E (0.85V)		-1I (0.85V)
					-1LI(2) (0.85V or 0.72V)

Notes:

1. In -2LE speed/temperature grade, devices can operate for a limited time with junction temperature of 110°C. Timing parameters adhere to the same speed file at 110°C as they do below 110°C, regardless of operating voltage (nominal at 0.85V or low voltage at 0.72V). Operation at 110°C Tj is limited to 1% of the device lifetime and can occur sequentially or at regular intervals as long as the total time does not exceed 1% of device lifetime.
2. In Zynq UltraScale+ MPSoCs, when operating the PL at low voltage (0.72V), the PS operates at nominal voltage (0.85V)

The ordering information shown in Figure 3 applies to all packages in the Zynq UltraScale+ MPSoCs.

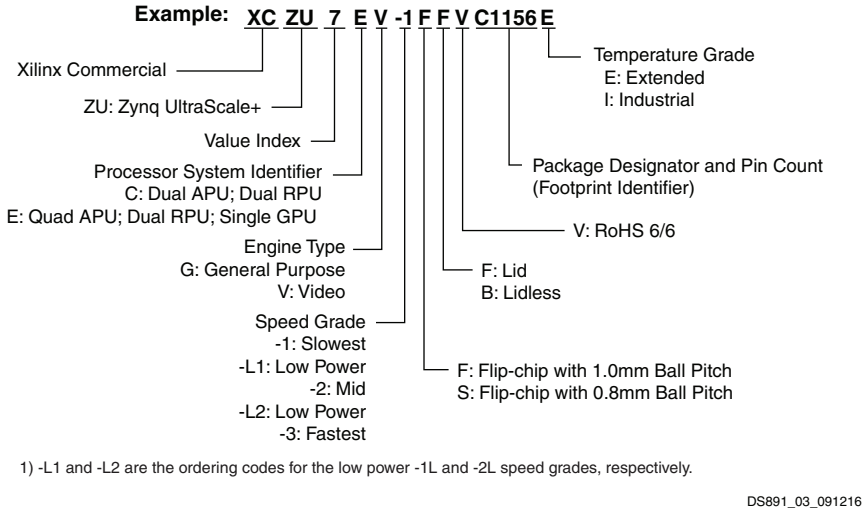

Figure 3: **Zynq UltraScale+ MPSoC Ordering Information**

Revision History

The following table shows the revision history for this document:

Date	Version	Description of Revisions
02/15/2017	1.4	Updated DSP count in Table 1, Table 3, and Table 5. Updated I/O Electrical Characteristics. Updated Table 12 with -2E speed grade.
09/23/2016	1.3	Updated Table 2; Table 3; Table 4; Table 6; Graphics Processing Unit (GPU); and NAND ONFI 3.1 Flash Controller.
06/03/2016	1.2	Added CG devices: Updated Table 1; Table 2; Table 3; Table 4; Table 5; Table 6; and Table 12. Added Video Encoder/Decoder (VCU); Table 7; and Power Examples (removed XPE Computed Range table). Updated: General Description; ARM Cortex-A53 Based Application Processing Unit (APU); Zynq UltraScale+ MPSoCs; Dynamic Memory Controller (DDRC); and Figure 3.
01/28/2016	1.1	Updated Table 1 and Table 2.
11/24/2015	1.0	Initial Xilinx release.
