Welcome to [E-XFL.COM](#)

[Embedded - System On Chip (SoC)](#): The Heart of Modern Embedded Systems

[Embedded - System On Chip (SoC)](#) refers to an integrated circuit that consolidates all the essential components of a computer system into a single chip. This includes a microprocessor, memory, and other peripherals, all packed into one compact and efficient package. SoCs are designed to provide a complete computing solution, optimizing both space and power consumption, making them ideal for a wide range of embedded applications.

What are [Embedded - System On Chip (SoC)](#)?

System On Chip (SoC) integrates multiple functions of a computer or electronic system onto a single chip. Unlike traditional multi-chip solutions, SoCs combine a central

Details

Product Status	Active
Architecture	MCU, FPGA
Core Processor	Quad ARM® Cortex®-A53 MPCore™ with CoreSight™, Dual ARM®Cortex™-R5 with CoreSight™, ARM Mali™-400 MP2
Flash Size	-
RAM Size	256KB
Peripherals	DMA, WDT
Connectivity	CANbus, EBI/EMI, Ethernet, I²C, MMC/SD/SDIO, SPI, UART/USART, USB OTG
Speed	533MHz, 600MHz, 1.3GHz
Primary Attributes	Zynq®UltraScale+™ FPGA, 256K+ Logic Cells
Operating Temperature	0°C ~ 100°C (TJ)
Package / Case	900-BBGA, FCBGA
Supplier Device Package	900-FCBGA (31x31)
Purchase URL	https://www.e-xfl.com/product-detail/xilinx/xczu5eg-2fbvb900e

Programmable Logic (PL)

Configurable Logic Blocks (CLB)

- Look-up tables (LUT)
- Flip-flops
- Cascadable adders

36Kb Block RAM

- True dual-port
- Up to 72 bits wide
- Configurable as dual 18Kb

UltraRAM

- 288Kb dual-port
- 72 bits wide
- Error checking and correction

DSP Blocks

- 27 x 18 signed multiply
- 48-bit adder/accumulator
- 27-bit pre-adder

Programmable I/O Blocks

- Supports LVCMOS, LVDS, and SSTL
- 1.0V to 3.3V I/O
- Programmable I/O delay and SerDes

JTAG Boundary-Scan

- IEEE Std 1149.1 Compatible Test Interface

PCI Express

- Supports Root complex and End Point configurations
- Supports up to Gen4 speeds
- Up to five integrated blocks in select devices

100G Ethernet MAC/PCS

- IEEE Std 802.3 compliant
- CAUI-10 (10x 10.3125Gb/s) or CAUI-4 (4x 25.78125Gb/s)
- RSFEC (IEEE Std 802.3bj) in CAUI-4 configuration
- Up to four integrated blocks in select devices

Interlaken

- Interlaken spec 1.2 compliant
- 64/67 encoding
- 12 x 12.5Gb/s or 6 x 25Gb/s
- Up to four integrated blocks in select devices

Video Encoder/Decoder (VCU)

- Available in EV devices
- Accessible from either PS or PL
- Simultaneous encode and decode
- H.264 and H.265 support

System Monitor in PL

- On-chip voltage and temperature sensing
- 10-bit 200KSPS ADC with up to 17 external inputs

Feature Summary

Table 1: **Zynq UltraScale+ MPSoC: CG Device Feature Summary**

	ZU2CG	ZU3CG	ZU4CG	ZU5CG	ZU6CG	ZU7CG	ZU9CG
Application Processing Unit	Dual-core ARM Cortex-A53 MPCore with CoreSight; NEON & Single/Double Precision Floating Point; 32KB/32KB L1 Cache, 1MB L2 Cache						
Real-Time Processing Unit	Dual-core ARM Cortex-R5 with CoreSight; Single/Double Precision Floating Point; 32KB/32KB L1 Cache, and TCM						
Embedded and External Memory	256KB On-Chip Memory w/ECC; External DDR4; DDR3; DDR3L; LPDDR4; LPDDR3; External Quad-SPI; NAND; eMMC						
General Connectivity	214 PS I/O; UART; CAN; USB 2.0; I2C; SPI; 32b GPIO; Real Time Clock; WatchDog Timers; Triple Timer Counters						
High-Speed Connectivity	4 PS-GTR; PCIe Gen1/2; Serial ATA 3.1; DisplayPort 1.2a; USB 3.0; SGMII

FFVB1156	35x35					120, 208 24, 0		120, 208 24, 0
FFVC1156	35x35						48, 312 20, 0	
FFVF1517	40x40						48, 416 24, 0	

Notes:

1. Go to Ordering Information for package designation details.
2. FB/FF packages have 1.0mm ball pitch. SB/SF packages have 0.8mm ball pitch.
3. All device package combinations bond out 4 PS-GTR transceivers.
4. All device package combinations bond out 214 PS I/O except ZU2CG and ZU3CG in the SBVA484 and SFVA625 packages, which bond out 170 PS I/Os.
5. Packages with the same last letter and number sequence, e.g., A484, are footprint compatible with all other UltraScale devices with the same sequence. The footprint compatible devices within this family are outlined.
6. All 58 HP I/O pins are powered by the same V_{CCO} supply.
7. GTH transceivers in the SFVC784 package support data rates up to 12.5Gb/s.

6. All 58 HP I/O pins are powered by the same V_{CCO} supply.
7. GTH transceivers in the SFVC784 package support data rates up to 12.5Gb/s.

ASIC-class capabilities afforded by the UltraScale MPSoC architecture while supporting rapid system development.

The inclusion of an application processor enables high-level operating system support, e.g., Linux. Other standard operating systems used with the Cortex-A53 processor are also available for the Zynq UltraScale+ MPSoC family. The PS and the PL are on separate power domains, enabling users to power down the PL for power management if required. The processors in the PS always boot first, allowing a software centric approach for PL configuration. PL configuration is managed by software running on the CPU, so it boots similar to an ASSP.

Processing System

Application Processing Unit (APU)

The key features of the APU include:

- 64-bit quad-core ARM Cortex-A53 MPCores. Features associated with each core include:
  - ARM v8-A Architecture
  - Operating target frequency: up to 1.5GHz
  - Single and double precision floating point:
    4 SP / 2 DP FLOPs
  - NEON Advanced SIMD support with single and double precision floating point instructions
  - A64 instruction set in 64-bit operating mode, A32/T32 instruction set in 32-bit operating mode
  - Level 1 cache (separate instruction and data, 32KB each for each Cortex-A53 CPU)
    - 2-way set-associative Instruction Cache with parity support
    - 4-way set-associative Data Cache with ECC support
  - Integrated memory management unit (MMU) per processor core
  - TrustZone for secure mode operation
  - Virtualization support
- Ability to operate in single processor, symmetric quad processor, and asymmetric quad-processor modes
- Integrated 16-way set-associative 1MB Unified Level 2 cache with ECC support
- Interrupts and Timers
  - Generic interrupt controller (GIC-400)
  - ARM generic timers (4 timers per CPU)
  - One watchdog timer (WDT)
  - One global timer
  - Two triple timers/counters (TTC)
- Little and big endian support
  - Big endian support in BE8 mode
- CoreSight debug and trace support
  - Embedded Trace Macrocell (ETM) for instruction trace
  - Cross trigger interface (CTI) enabling hardware breakpoints and triggers
- ACP interface to PL for I/O coherency and Level 2 cache allocation
- ACE interface to PL for full coherency
- Power island gating on each processor core
- Optional eFUSE disable per core

Real-Time Processing Unit (RPU)

- Dual-core ARM Cortex-R5 MPCores. Features associated with each core include:
  - ○ ARM v7-R Architecture (32-bit)
  - ○ Operating target frequency: Up to 600MHz
  - ○ A32/T32 instruction set support
  - ○ 4-way set-associative Level 1 caches (separate instruction and data, 32KB each) with ECC support
  - ○ Integrated Memory Protection Unit (MPU) per processor
  - ○ 128KB Tightly Coupled Memory (TCM) with ECC support
  - ○ TCMs can be combined to become 256KB in lockstep mode
- Ability to operate in single-processor or dual-processor modes (split and lock-step)
- Little and big endian support
- Dedicated SWDT and two Triple Timer Counters (TTC)
- CoreSight debug and trace support
  - ○ Embedded Trace Macrocell (ETM) for instruction and trace
  - ○ Cross trigger interface (CTI) enabling hardware breakpoints and triggers
- Optional eFUSE disable

Full-Power Domain DMA (FPD-DMA) and Low-Power Domain DMA (LPD-DMA)

- Two general-purpose DMA controllers one in the full-power domain (FPD-DMA) and one in the low-power domain (LPD-DMA)
- Eight independent channels per DMA
- Multiple transfer types:
  - ○ Memory-to-memory
  - ○ Memory-to-peripheral
  - ○ Peripheral-to-memory and
  - ○ Scatter-gather
- 8 peripheral interfaces per DMA
- TrustZone per DMA for optional secure operation

Xilinx Memory Protection Unit (XMPU)

- Region based memory protection unit
- Up to 16 regions
- Each region supports address alignment of 1MB or 4KB
- Regions can overlap; the higher region number has priority
- Each region can be independently enabled or disabled
- Each region has a start and end address

Graphics Processing Unit (GPU)

- Supports OpenGL ES 1.1 & 2.0
- Supports OpenVG 1.1
- Operating target frequency: up to 667MHz
- Single Geometry Processor and two Pixel processor
- Pixel Fill Rate: 2 Mpixel/sec/MHz
- Triangle Rate: 0.11 Mtriangles/sec/MHz
- 64KB Level 2 Cache (read-only)
- 4X and 16X Anti-aliasing Support
- ETC1 texture compression to reduce external memory bandwidth
- Extensive texture format support
    - RGBA 8888, 565, 1556
    - Mono 8, 16
    - YUV format support
- Automatic load balancing across different graphics shader engines
- 2D and 3D graphic acceleration
- Up to 4K texture input and 4K render output resolutions
- Each geometry processor and pixel processor supports 4KB page MMU
- Power island gating on each GPU engine and shared cache
- Optional eFUSE disable

Dynamic Memory Controller (DDRC)

- DDR3, DDR3L, DDR4, LPDDR3, LPDDR4
- Target data rate: Up to 2400Mb/s DDR4 operation in -1 speed grade
- 32-bit and 64-bit bus width support for DDR4, DDR3, DDR3L, or LPDDR3 memories, and 32-bit bus width support for LPDDR4 memory
- ECC support (using extra bits)
- Up to a total DRAM capacity of 32GB

- Low power modes

  o Active/precharge power down

  o Self-refresh, including clean exit from self-refresh after a controller power cycle

- Enhanced DDR training by allowing software to measure read/write eye and make delay adjustments dynamically

- Independent performance monitors for read path and write path

- Integration of PHY Debug Access Port (DAP) into JTAG for testing

The DDR memory controller is multi-ported and enables the PS and the PL to have shared access to a common memory. The DDR controller features six AXI slave ports for this purpose:

- Two 128-bit AXI ports from the ARM Cortex-A53 CPU(s), RPU (ARM Cortex-R5 and LPD peripherals), GPU, high speed peripherals (USB3, PCIe & SATA), and High Performance Ports (HP0 & HP1) from the PL through the Cache Coherent Interconnect (CCI)

- One 64-bit port is dedicated for the ARM Cortex-R5 CPU(s)

- One 128-bit AXI port from the DisplayPort and HP2 port from the PL

- One 128-bit AXI port from HP3 and HP4 ports from the PL

- One 128-bit AXI port from General DMA and HP5 from the PL

High-Speed Connectivity Peripherals

PCIe

- Compliant with the PCI Express Base Specification 2.1

- Fully compliant with PCI Express transaction ordering rules

- Lane width: x1, x2, or x4 at Gen1 or Gen2 rates

- 1 Virtual Channel

- Full duplex PCIe port

- End Point and single PCIe link Root Port

- Root Port supports Enhanced Configuration Access Mechanism (ECAM), Cfg Transaction generation

- Root Port support for INTx, and MSI

- Endpoint support for MSI or MSI-X

  o 1 physical function, no SR-IOV

  o No relaxed or ID ordering

  o Fully configurable BARs

  o INTx not recommended, but can be generated

  o Endpoint to support configurable target/slave apertures with address translation and Interrupt capability

- Audio support
  - o A single stream carries up to 8 LPCM channels at 192kHz with 24-bit resolution
  - o Supports compressed formats including DRA, Dolby MAT, and DTS HD
  - o Multi-Stream Transport can extend the number of audio channels
  - o Audio copy protection
  - o 2-channel streaming or input from the PL
  - o Multi-channel non-streaming audio from a memory audio frame buffer
- Includes a System Time Clock (STC) compliant with ISO/IEC 13818-1
- Boot-time display using minimum resources

Platform Management Unit (PMU)

- Performs system initialization during boot
- Acts as a delegate to the application and real-time processors during sleep state
- Initiates power-up and restart after the wake-up request
- Maintains the system power state at all time
- Manages the sequence of low-level events required for power-up, power-down, reset, clock gating, and power gating of islands and domains
- Provides error management (error handling and reporting)
- Provides safety check functions (e.g., memory scrubbing)

The PMU includes the following blocks:

- Platform management processor
- Fixed ROM for boot-up of the device
- 128KB RAM with ECC for optional user/firmware code
- Local and global registers to manage power-down, power-up, reset, clock gating, and power gating requests
- Interrupt controller with 16 interrupts from other modules and the inter-processor communication interface (IPI)
- GPI and GPO interfaces to and from PS I/O and PL
- JTAG interface for PMU debug
- Optional User-Defined Firmware

Configuration Security Unit (CSU)

- Triple redundant Secure Processor Block (SPB) with built-in ECC
- Crypto Interface Block consisting of
    - o 256-bit AES-GCM
    - o SHA-3/384
    - o 4096-bit RSA
- Key Management Unit
- Built-in DMA
- PCAP interface
- Supports ROM validation during pre-configuration stage
- Loads First Stage Boot Loader (FSBL) into OCM in either secure or non-secure boot modes
- Supports voltage, temperature, and frequency monitoring after configuration

Xilinx Peripheral Protection Unit (XPPU)

- Provides peripheral protection support
- Up to 20 masters simultaneously
- Multiple aperture sizes
- Access control for a specified set of address apertures on a per master basis
- 64KB peripheral apertures and controls access on per peripheral basis

I/O Peripherals

The IOP unit contains the data communication peripherals. Key features of the IOP include:

Triple-Speed Gigabit Ethernet

- Compatible with IEEE Std 802.3 and supports 10/100/1000Mb/s transfer rates (Full and Half duplex)
- Supports jumbo frames
- Built-in Scatter-Gather DMA capability
- Statistics counter registers for RMON/MIB
- Multiple I/O types (1.8, 2.5, 3.3V) on RGMII interface with external PHY
- GMII interface to PL to support interfaces as: TBI, SGMII, and RGMII v2.0 support
- Automatic pad and cyclic redundancy check (CRC) generation on transmitted frames
- Transmitter and Receive IP, TCP, and UDP checksum offload
- MDIO interface for physical layer management

- Sleep Mode with automatic wake-up

- Snoop Mode

- 16-bit timestamping for receive messages

- Both internal generated reference clock and external reference clock input from MIO

- Guarantee clock sampling edge between 80 to 83% at 24MHz reference clock input

- Optional eFUSE disable per port

USB 2.0

- Two USB controllers (configurable as USB 2.0 or USB 3.0)

- Host, device and On-The-Go (OTG) modes

- High Speed, Full Speed, and Low Speed

- Up to 12 endpoints

- 8-bit ULPI External PHY Interface

- The USB host controller registers and data structures are compliant to Intel xHCI specifications.

- 64-bit AXI master port with built-in DMA

- Power management features: hibernation mode

Static Memory Interfaces

The static memory interfaces support external static memories.

- ONFI 3.1 NAND flash support with up to 24-bit ECC

- 1-bit SPI, 2-bit SPI, 4-bit SPI (Quad-SPI), or two Quad-SPI (8-bit) serial NOR flash

- 8-bit eMMC interface supporting managed NAND flash

NAND ONFI 3.1 Flash Controller

- ONFI 3.1 compliant

- Supports chip select reduction per ONFI 3.1 spec

- SLC NAND for boot/configuration and data storage

- ECC options based on SLC NAND

   o   1, 4, or 8 bits per 512+spare bytes

   o   24 bits per 1024+spare bytes

- Maximum throughput as follows

   o   Asynchronous mode (SDR) 24.3MB/s

   o   Synchronous mode (NV-DDR) 112MB/s (for 100MHz flash clock)

- 8-bit SDR NAND interface

Interconnect

All the blocks are connected to each other and to the PL through a multi-layered ARM Advanced Microprocessor Bus Architecture (AMBA) AXI interconnect. The interconnect is non-blocking and supports multiple simultaneous master-slave transactions.

The interconnect is designed with latency sensitive masters, such as the ARM CPU, having the shortest paths to memory, and bandwidth critical masters, such as the potential PL masters, having high throughput connections to the slaves with which they need to communicate.

Traffic through the interconnect can be regulated through the Quality of Service (QoS) block in the interconnect. The QoS feature is used to regulate traffic generated by the CPU, DMA controller, and a combined entity representing the masters in the IOP.

PS Interfaces

PS interfaces include external interfaces going off-chip or signals going from PS to PL.

PS External Interfaces

The Zynq UltraScale+ MPSoC's external interfaces use dedicated pins that cannot be assigned as PL pins. These include:

- Clock, reset, boot mode, and voltage reference
- Up to 78 dedicated multiplexed I/O (MIO) pins, software-configurable to connect to any of the internal I/O peripherals and static memory controllers
- 32-bit or 64-bit DDR4/DDR3/DDR3L/LPDDR3 memories with optional ECC
- 32-bit LPDDR4 memory with optional ECC
- 4 channels (TX and RX pair) for transceivers

MIO Overview

The IOP peripherals communicate to external devices through a shared pool of up to 78 dedicated multiplexed I/O (MIO) pins. Each peripheral can be assigned one of several pre-defined groups of pins, enabling a flexible assignment of multiple devices simultaneously. Although 78 pins are not enough for simultaneous use of all the I/O peripherals, most IOP interface signals are available to the PL, allowing use of standard PL I/O pins when powered up and properly configured. Extended multiplexed I/O (EMIO) allows unmapped PS peripherals to access PL I/O.

Port mappings can appear in multiple locations. For example, there are up to 12 possible port mappings for CAN pins. The PS Configuration Wizard (PCW) tool aids in peripheral and static memory pin mapping.

Table 8: **MIO Peripheral Interface Mapping**

Peripheral Interface	MIO	EMIO
Quad-SPI NAND	Yes	No
USB2.0: 0,1	Yes: External PHY	No
SDIO 0,1	Yes	Yes
SPI: 0,1 I2C: 0,1 CAN: 0,1 GPIO	Yes CAN: External PHY GPIO: Up to 78 bits	Yes CAN: External PHY GPIO: Up to 96 bits
GigE: 0,1,2,3	RGMII v2.0: External PHY	Supports GMII, RGMII v2.0 (HSTL), RGMII v1.3, MII, SGMII, and 1000BASE-X in Programmable Logic
UART: 0,1	Simple UART: Only two pins (TX and RX)	Full UART (TX, RX, DTR, DCD, DSR, RI, RTS, and CTS) requires either: • Two Processing System (PS) pins (RX and TX) through MIO and six additional Programmable Logic (PL) pins, *or* • Eight Programmable Logic (PL) pins
Debug Trace Ports	Yes: Up to 16 trace bits	Yes: Up to 32 trace bits
Processor JTAG	Yes	Yes

Transceiver (PS-GTR)

The four PS-GTR transceivers, which reside in the full power domain (FPD), support data rates of up to 6.0Gb/s. All the protocols cannot be pinned out at the same time. At any given time, four differential pairs can be pinned out using the transceivers. This is user programmable via the high-speed I/O multiplexer (HS-MIO).

• A Quad transceiver PS-GTR (TX/RX pair) able to support following standards simultaneously

  o x1, x2, or x4 lane of PCIe at Gen1 (2.5Gb/s) or Gen2 (5.0Gb/s) rates

  o 1 or 2 lanes of DisplayPort (TX only) at 1.62Gb/s, 2.7Gb/s, or 5.4Gb/s

  o 1 or 2 SATA channels at 1.5Gb/s, 3.0Gb/s, or 6.0Gb/s

  o 1 or 2 USB3.0 channels at 5.0Gb/s

  o 1-4 Ethernet SGMII channels at 1.25Gb/s

• Provides flexible host-programmable multiplexing function for connecting the transceiver resources to the PS masters (DisplayPort, PCIe, Serial-ATA, USB3.0, and GigE).

Programmable Logic

This section covers the information about blocks in the Programmable Logic (PL).

Device Layout

UltraScale architecture-based devices are arranged in a column-and-grid layout. Columns of resources are combined in different ratios to provide the optimum capability for the device density, target market or application, and device cost. At the core of UltraScale+ MPSoCs is the processing system that displaces some of the full or partial columns of programmable logic resources. Figure 1 shows a device-level view with resources grouped together. For simplicity, certain resources such as the processing system, integrated blocks for PCIe, configuration logic, and System Monitor are not shown.
DS891_01_012915

Figure 1: **Device with Columnar Resources**

Resources within the device are divided into segmented clock regions. The height of a clock region is 60 CLBs. A bank of 52 I/Os, 24 DSP slices, 12 block RAMs, or 4 transceiver channels also matches the height of a clock region. The width of a clock region is essentially the same in all cases, regardless of device size or the mix of resources in the region, enabling repeatable timing results. Each segmented clock region contains vertical and horizontal clock routing that span its full height and width. These horizontal and vertical clock routes can be segmented at the clock region boundary to provide a flexible, high-performance, low-power clock distribution architecture. Figure 2 is a representation of a device divided into regions.

PLL

With fewer features than the MMCM, the two PLLs in a clock management tile are primarily present to provide the necessary clocks to the dedicated memory interface circuitry. The circuit at the center of the PLLs is similar to the MMCM, with PFD feeding a VCO and programmable M, D, and O counters. There are two divided outputs to the device fabric per PLL as well as one clock plus one enable signal to the memory interface circuitry.

Zynq UltraScale+ MPSoCs are equipped with five additional PLLs in the PS for independently configuring the four primary clock domains with the PS: the APU, the RPU, the DDR controller, and the I/O peripherals.

Clock Distribution

Clocks are distributed throughout Zynq UltraScale+ MPSoCs via buffers that drive a number of vertical and horizontal tracks. There are 24 horizontal clock routes per clock region and 24 vertical clock routes per clock region with 24 additional vertical clock routes adjacent to the MMCM and PLL. Within a clock region, clock signals are routed to the device logic (CLBs, etc.) via 16 gateable leaf clocks.

Several types of clock buffers are available. The BUFGCE and BUFCE_LEAF buffers provide clock gating at the global and leaf levels, respectively. BUFGCTRL provides glitchless clock muxing and gating capability. BUFGCE_DIV has clock gating capability and can divide a clock by 1 to 8. BUFG_GT performs clock division from 1 to 8 for the transceiver clocks. In MPSoCs, clocks can be transferred from the PS to the PL using dedicated buffers.

Memory Interfaces

Memory interface data rates continue to increase, driving the need for dedicated circuitry that enables high performance, reliable interfacing to current and next-generation memory technologies. Every Zynq UltraScale+ MPSoC includes dedicated physical interfaces (PHY) blocks located between the CMT and I/O columns that support implementation of high-performance PHY blocks to external memories such as DDR4, DDR3, QDRII+, and RLDRAM3. The PHY blocks in each I/O bank generate the address/control and data bus signaling protocols as well as the precision clock/data alignment required to reliably communicate with a variety of high-performance memory standards. Multiple I/O banks can be used to create wider memory interfaces.

As well as external parallel memory interfaces, Zynq UltraScale+ MPSoC can communicate to external serial memories, such as Hybrid Memory Cube (HMC), via the high-speed serial transceivers. All transceivers in the UltraScale architecture support the HMC protocol, up to 15Gb/s line rates. UltraScale architecture-based devices support the highest bandwidth HMC configuration of 64 lanes with a single device.

Digital Signal Processing

DSP applications use many binary multipliers and accumulators, best implemented in dedicated DSP slices. All UltraScale architecture-based devices have many dedicated, low-power DSP slices, combining high speed with small size while retaining system design flexibility.

Each DSP slice fundamentally consists of a dedicated 27 × 18 bit twos complement multiplier and a 48-bit accumulator. The multiplier can be dynamically bypassed, and two 48-bit inputs can feed a single-instruction-multiple-data (SIMD) arithmetic unit (dual 24-bit add/subtract/accumulate or quad 12-bit add/subtract/accumulate), or a logic unit that can generate any one of ten different logic functions of the two operands.

The DSP includes an additional pre-adder, typically used in symmetrical filters. This pre-adder improves performance in densely packed designs and reduces the DSP slice count by up to 50%. The 96-bit-wide XOR function, programmable to 12, 24, 48, or 96-bit widths, enables performance improvements when implementing forward error correction and cyclic redundancy checking algorithms.

The DSP also includes a 48-bit-wide pattern detector that can be used for convergent or symmetric rounding. The pattern detector is also capable of implementing 96-bit-wide logic functions when used in conjunction with the logic unit.

The DSP slice provides extensive pipelining and extension capabilities that enhance the speed and efficiency of many applications beyond digital signal processing, such as wide dynamic bus shifters, memory address generators, wide bus multiplexers, and memory-mapped I/O register files. The accumulator can also be used as a synchronous up/down counter.

System Monitor

The System Monitor blocks in the UltraScale architecture are used to enhance the overall safety, security, and reliability of the system by monitoring the physical environment via on-chip power supply and temperature sensors.

All UltraScale architecture-based devices contain at least one System Monitor. The System Monitor in UltraScale+ devices is similar to the Kintex UltraScale and Virtex UltraScale devices but with the addition of a PMBus interface.

Zynq UltraScale+ MPSoCs contain one System Monitor in the PL and an additional block in the PS. The System Monitor in the PL has the same features as the block in UltraScale+ FPGAs. See Table 11.

Table 11: **Key System Monitor Features**

	Zynq UltraScale+ MPSoC PL	**Zynq UltraScale+ MPSoC PS**
ADC	10-bit 200kSPS	10-bit 1MSPS
Interfaces	JTAG, I2C, DRP, PMBus	APB

In FPGAs and the MPSoC PL, sensor outputs and up to 17 user-allocated external analog inputs are digitized using a 10-bit 200 kilo-sample-per-second (kSPS) ADC, and the measurements are stored in registers that can be accessed via internal FPGA (DRP), JTAG, PMBus, or I2C interfaces. The I2C interface and PMBus allow the on-chip monitoring to be easily accessed by the System Manager/Host before and after device configuration.

The System Monitor in the MPSoC PS uses a 10-bit, 1 mega-sample-per-second (MSPS) ADC to digitize the sensor inputs. The measurements are stored in registers and are accessed via the Advanced Peripheral Bus (APB) interface by the processors and the PMU in the PS.

Packaging

The UltraScale architecture-based devices are available in a variety of organic flip-chip and lidless flip-chip packages supporting different quantities of I/Os and transceivers. Maximum supported performance can depend on the style of package and its material. Always refer to the specific device data sheet for performance specifications by package type.

In flip-chip packages, the silicon device is attached to the package substrate using a high-performance flip-chip process. Decoupling capacitors are mounted on the package substrate to optimize signal integrity under simultaneous switching of outputs (SSO) conditions.

System-Level Features

Several functions span both the PS and PL and include:

- Reset Management
- Clock Management
- Power Domains
- PS Boot and Device Configuration
- Hardware and Software Debug Support

Reset Management

The reset management function provides the ability to reset the entire device or individual units within it. The PS supports these reset functions and signals:

- External and internal power-on reset signal
- Warm reset
- Watchdog timer reset
- User resets to PL
- Software, watchdog timer, or JTAG provided resets
- Security violation reset (locked down reset)

PS Boot and Device Configuration

Zynq UltraScale+ MPSoCs use a multi-stage boot process that supports both a non-secure and a secure boot. The PS is the master of the boot and configuration process. For a secure boot, the AES-GCM, SHA-3/384 decrypts and authenticates the images while the 4096-bit RSA block authenticates the image.

Upon reset, the device mode pins are read to determine the primary boot device to be used: NAND, Quad-SPI, SD, eMMC, or JTAG. JTAG can only be used as a non-secure boot source and is intended for debugging purposes. The CSU executes code out of on-chip ROM and copies the first stage boot loader (FSBL) from the boot device to the OCM.

After copying the FSBL to OCM, one of the processors, either the Cortex-A53 or Cortex-R5, executes the FSBL. Xilinx supplies example FSBLs or users can create their own. The FSBL initiates the boot of the PS and can load and configure the PL, or configuration of the PL can be deferred to a later stage. The FSBL typically loads either a user application or an optional second stage boot loader (SSBL), such as U-Boot. Users obtain example SSBL from Xilinx or a third party, or they can create their own SSBL. The SSBL continues the boot process by loading code from any of the primary boot devices or from other sources such as USB, Ethernet, etc. If the FSBL did not configure the PL, the SSBL can do so, or again, the configuration can be deferred to a later stage.

The static memory interface controller (NAND, eMMC, or Quad-SPI) is configured using default settings. To improve device configuration speed, these settings can be modified by information provided in the boot image header. The ROM boot image is not user readable or callable after boot.

Hardware and Software Debug Support

The debug system used in Zynq UltraScale+ MPSoCs is based on the ARM CoreSight architecture. It uses ARM CoreSight components including an embedded trace controller (ETC), an embedded trace Macrocell (ETM) for each Cortex-A53 and Cortex-R5 processor, and a system trace Macrocell (STM). This enables advanced debug features like event trace, debug breakpoints and triggers, cross-trigger, and debug bus dump to memory. The programmable logic can be debugged with the Xilinx Vivado Logic Analyzer.

Debug Ports

Three JTAG ports are available and can be chained together or used separately. When chained together, a single port is used for chip-level JTAG functions, ARM processor code downloads and run-time control operations, PL configuration, and PL debug with the Vivado Logic Analyzer. This enables tools such as the Xilinx Software Development Kit (SDK) and Vivado Logic Analyzer to share a single download cable from Xilinx.

When the JTAG chain is split, one port is used to directly access the ARM DAP interface. This CoreSight interface enables the use of ARM-compliant debug and software development tools such as Development Studio 5 (DS-5™). The other JTAG port can then be used by the Xilinx FPGA tools for access to the PL, including configuration bitstream downloads and PL debug with the Vivado Logic Analyzer. In this mode, users can download to and debug the PL in the same manner as a stand-alone FPGA.
