
Welcome to E-XFL.COM

Embedded - System On Chip (SoC): The Heart of Modern Embedded Systems

Embedded - System On Chip (SoC) refers to an integrated circuit that consolidates all the essential components of a computer system into a single chip. This includes a microprocessor, memory, and other peripherals, all packed into one compact and efficient package. SoCs are designed to provide a complete computing solution, optimizing both space and power consumption, making them ideal for a wide range of embedded applications.

What are Embedded - System On Chip (SoC)?

System On Chip (SoC) integrates multiple functions of a computer or electronic system onto a single chip. Unlike traditional multi-chip solutions, SoCs combine a central

Details	
Product Status	Active
Architecture	MCU, FPGA
Core Processor	Quad ARM® Cortex®-A53 MPCore™ with CoreSight™, Dual ARM®Cortex™-R5 with CoreSight™, ARM Mali™-400 MP2
Flash Size	-
RAM Size	256KB
Peripherals	DMA, WDT
Connectivity	CANbus, EBI/EMI, Ethernet, I²C, MMC/SD/SDIO, SPI, UART/USART, USB OTG
Speed	500MHz, 600MHz, 1.2GHz
Primary Attributes	Zynq®UltraScale+™ FPGA, 504K+ Logic Cells
Operating Temperature	-40°C ~ 100°C (TJ)
Package / Case	1517-BBGA, FCBGA
Supplier Device Package	1517-FCBGA (40x40)
Purchase URL	https://www.e-xfl.com/product-detail/xilinx/xczu7ev-l1ffvf1517i

ARM Mali-400 Based GPU

- Supports OpenGL ES 1.1 and 2.0
- Supports OpenVG 1.1
- GPU frequency: Up to 667MHz
- Single Geometry Processor, Two Pixel Processors
- Pixel Fill Rate: 2 Mpixels/sec/MHz
- Triangle Rate: 0.11 Mtriangles/sec/MHz
- 64KB L2 Cache
- Power island gating

External Memory Interfaces

- Multi-protocol dynamic memory controller
- 32-bit or 64-bit interfaces to DDR4, DDR3, DDR3L, or LPDDR3 memories, and 32-bit interface to LPDDR4 memory
- ECC support in 64-bit and 32-bit modes
- Up to 32GB of address space using single or dual rank of 8-, 16-, or 32-bit-wide memories
- Static memory interfaces
  - eMMC4.51 Managed NAND flash support
  - ONFI3.1 NAND flash with 24-bit ECC
  - 1-bit SPI, 2-bit SPI, 4-bit SPI (Quad-SPI), or two Quad-SPI (8-bit) serial NOR flash

8-Channel DMA Controller

- Two DMA controllers of 8-channels each
- Memory-to-memory, memory-to-peripheral, peripheral-to-memory, and scatter-gather transaction support

Serial Transceivers

- Four dedicated PS-GTR receivers and transmitters supports up to 6.0Gb/s data rates
  - Supports SGMII tri-speed Ethernet, PCI Express® Gen2, Serial-ATA (SATA), USB3.0, and DisplayPort

Dedicated I/O Peripherals and Interfaces

- PCI Express — Compliant with PCIe® 2.1 base specification
  - Root complex and End Point configurations
  - x1, x2, and x4 at Gen1 or Gen2 rates
- SATA Host
  - 1.5, 3.0, and 6.0Gb/s data rates as defined by SATA Specification, revision 3.1
  - Supports up to two channels
- DisplayPort Controller
  - Up to 5.4Gb/s rate
  - Up to two TX lanes (no RX support)
- Four 10/100/1000 tri-speed Ethernet MAC peripherals with IEEE Std 802.3 and IEEE Std 1588 revision 2.0 support
  - Scatter-gather DMA capability
  - Recognition of IEEE Std 1588 rev.2 PTP frames
  - GMII, RGMII, and SGMII interfaces
  - Jumbo frames
- Two USB 3.0/2.0 Device, Host, or OTG peripherals, each supporting up to 12 endpoints
  - USB 3.0/2.0 compliant device IP core
  - Super-speed, high- speed, full-speed, and low-speed modes
  - Intel XHCI- compliant USB host
- Two full CAN 2.0B-compliant CAN bus interfaces
  - CAN 2.0-A and CAN 2.0-B and ISO 118981-1 standard compliant
- Two SD/SDIO 2.0/eMMC4.51 compliant controllers
- Two full-duplex SPI ports with three peripheral chip selects
- Two high-speed UARTs (up to 1Mb/s)
- Two master and slave I2C interfaces
- Up to 78 flexible multiplexed I/O (MIO) (up to three banks of 26 I/Os) for peripheral pin assignment
- Up to 96 EMIOs (up to three banks of 32 I/Os) connected to the PL

Interconnect

- High-bandwidth connectivity within PS and between PS and PL
- ARM AMBA® AXI4-based
- QoS support for latency and bandwidth control
- Cache Coherent Interconnect (CCI)

System Memory Management

- System Memory Management Unit (SMMU)
- Xilinx Memory Protection Unit (XMPU)

Platform Management Unit

- Power gates PS peripherals, power islands, and power domains
- Clock gates PS peripheral user firmware option

Configuration and Security Unit

- Boots PS and configures PL
- Supports secure and non-secure boot modes

System Monitor in PS

- On-chip voltage and temperature sensing

Feature Summary

Table 1: **Zynq UltraScale+ MPSoC: CG Device Feature Summary**

	ZU2CG	ZU3CG	ZU4CG	ZU5CG	ZU6CG	ZU7CG	ZU9CG
Application Processing Unit	Dual-core ARM Cortex-A53 MPCore with CoreSight; NEON & Single/Double Precision Floating Point; 32KB/32KB L1 Cache, 1MB L2 Cache						
Real-Time Processing Unit	Dual-core ARM Cortex-R5 with CoreSight; Single/Double Precision Floating Point; 32KB/32KB L1 Cache, and TCM						
Embedded and External Memory	256KB On-Chip Memory w/ECC; External DDR4; DDR3; DDR3L; LPDDR4; LPDDR3; External Quad-SPI; NAND; eMMC						
General Connectivity	214 PS I/O; UART; CAN; USB 2.0; I2C; SPI; 32b GPIO; Real Time Clock; WatchDog Timers; Triple Timer Counters						
High-Speed Connectivity	4 PS-GTR; PCIe Gen1/2; Serial ATA 3.1; DisplayPort 1.2a; USB 3.0; SGMII						
System Logic Cells	103,320	154,350	192,150	256,200	469,446	504,000	599,550

Notes:

1. Go to Ordering Information for package designation details.(5)
2. FB/FF packages have 1.0mm ball pitch. SB/SF packages have 0.8mm ball pitch.
3. All device package combinations bond out 4 PS-GTR transceivers.
4. All device package combinations bond out 214 PS I/O except ZU2EG and ZU3EG in the SBVA484 and SFVA625 packages, which bond out 170 PS I/Os.
5. Packages with the same last letter and number sequence, e.g., A484, are footprint compatible with all other UltraScale devices with the same sequence. The footprint compatible devices within this family are outlined.
6. All 58 HP I/O pins are powered by the same V_{CCO} supply.
7. GTH transceivers in the SFVC784 package support data rates up to 12.5Gb/s.

Table 5: **Zynq UltraScale+ MPSoC: EV Device Feature Summary**

	ZU4EV	ZU5EV	ZU7EV
Application Processing Unit	Quad-core ARM Cortex-A53 MPCore with CoreSight; NEON & Single/Double Precision Floating Point; 32KB/32KB L1 Cache, 1MB L2 Cache

Notes:

1. Go to Ordering Information for package designation details.
2. FB/FF packages have 1.0mm ball pitch. SF packages have 0.8mm ball pitch.
3. All device package combinations bond out 4 PS-GTR transceivers.
4. Packages with the same last letter and number sequence, e.g., C784, are footprint compatible with all other UltraScale devices with the same sequence. The footprint compatible devices within this family are outlined.
5. GTH transceivers in the SFVC784 package support data rates up to 12.5Gb/s.

ASIC-class capabilities afforded by the UltraScale MPSoC architecture while supporting rapid system development.

The inclusion of an application processor enables high-level operating system support, e.g., Linux. Other standard operating systems used with the Cortex-A53 processor are also available for the Zynq UltraScale+ MPSoC family. The PS and the PL are on separate power domains, enabling users to power down the PL for power management if required. The processors in the PS always boot first, allowing a software centric approach for PL configuration. PL configuration is managed by software running on the CPU, so it boots similar to an ASSP.

Real-Time Processing Unit (RPU)

- Dual-core ARM Cortex-R5 MPCores. Features associated with each core include:
  - ARM v7-R Architecture (32-bit)
  - Operating target frequency: Up to 600MHz
  - A32/T32 instruction set support
  - 4-way set-associative Level 1 caches (separate instruction and data, 32KB each) with ECC support
  - Integrated Memory Protection Unit (MPU) per processor
  - 128KB Tightly Coupled Memory (TCM) with ECC support
  - TCMs can be combined to become 256KB in lockstep mode
- Ability to operate in single-processor or dual-processor modes (split and lock-step)
- Little and big endian support
- Dedicated SWDT and two Triple Timer Counters (TTC)
- CoreSight debug and trace support
  - Embedded Trace Macrocell (ETM) for instruction and trace
  - Cross trigger interface (CTI) enabling hardware breakpoints and triggers
- Optional eFUSE disable

Full-Power Domain DMA (FPD-DMA) and Low-Power Domain DMA (LPD-DMA)

- Two general-purpose DMA controllers one in the full-power domain (FPD-DMA) and one in the low-power domain (LPD-DMA)
- Eight independent channels per DMA
- Multiple transfer types:
  - Memory-to-memory
  - Memory-to-peripheral
  - Peripheral-to-memory and
  - Scatter-gather
- 8 peripheral interfaces per DMA
- TrustZone per DMA for optional secure operation

Xilinx Memory Protection Unit (XMPU)

- Region based memory protection unit
- Up to 16 regions
- Each region supports address alignment of 1MB or 4KB
- Regions can overlap; the higher region number has priority
- Each region can be independently enabled or disabled
- Each region has a start and end address

Graphics Processing Unit (GPU)

- Supports OpenGL ES 1.1 & 2.0
- Supports OpenVG 1.1
- Operating target frequency: up to 667MHz
- Single Geometry Processor and two Pixel processor
- Pixel Fill Rate: 2 Mpixel/sec/MHz
- Triangle Rate: 0.11 Mtriangles/sec/MHz
- 64KB Level 2 Cache (read-only)
- 4X and 16X Anti-aliasing Support
- ETC1 texture compression to reduce external memory bandwidth
- Extensive texture format support
  - RGBA 8888, 565, 1556
  - Mono 8, 16
  - YUV format support
- Automatic load balancing across different graphics shader engines
- 2D and 3D graphic acceleration
- Up to 4K texture input and 4K render output resolutions
- Each geometry processor and pixel processor supports 4KB page MMU
- Power island gating on each GPU engine and shared cache
- Optional eFUSE disable

Dynamic Memory Controller (DDRC)

- DDR3, DDR3L, DDR4, LPDDR3, LPDDR4
- Target data rate: Up to 2400Mb/s DDR4 operation in -1 speed grade
- 32-bit and 64-bit bus width support for DDR4, DDR3, DDR3L, or LPDDR3 memories, and 32-bit bus width support for LPDDR4 memory
- ECC support (using extra bits)
- Up to a total DRAM capacity of 32GB

SATA

- Compliant with SATA 3.1 Specification
- SATA host port supports up to 2 external devices
- Compliant with Advanced Host Controller Interface ('AHCI') ver. 1.3
- 1.5Gb/s, 3.0Gb/s, and 6.0Gb/s data rates
- Power management features: supports partial and slumber modes

USB 3.0

- Two USB controllers (configurable as USB 2.0 or USB 3.0)
- Up to 5.0Gb/s data rate
- Host and Device modes
  - Super Speed, High Speed, Full Speed, and Low Speed
  - Up to 12 endpoints
  - The USB host controller registers and data structures are compliant to Intel xHCI specifications
  - 64-bit AXI master port with built-in DMA
  - Power management features: Hibernation mode

DisplayPort Controller

- 4K Display Processing with DisplayPort output
  - Maximum resolution of 4K x 2K-30 (30Hz pixel rate)
  - DisplayPort AUX channel, and Hot Plug Detect (HPD) on the output
  - RGB YCbCr, 4:2:0; 4:2:2, 4:4:4 with 6, 8, 10, and 12b/c
  - Y-only, xvYCC, RGB 4:4:4, YCbCr 4:4:4, YCbCr 4:2:2, and YCbCr 4:2:0 video format with 6,8,10 and 12-bits per color component
  - 256-color palette
  - Multiple frame buffer formats
  - 1, 2, 4, 8 bits per pixel (bpp) via a palette
  - 16, 24, 32bpp
  - Graphics formats such as RGBA8888, RGB555, etc.
- Accepts streaming video from the PL or dedicated DMA controller
- Enables Alpha blending of graphics and Chroma keying

- Audio support
  - A single stream carries up to 8 LPCM channels at 192kHz with 24-bit resolution
  - Supports compressed formats including DRA, Dolby MAT, and DTS HD
  - Multi-Stream Transport can extend the number of audio channels
  - Audio copy protection
  - 2-channel streaming or input from the PL
  - Multi-channel non-streaming audio from a memory audio frame buffer
- Includes a System Time Clock (STC) compliant with ISO/IEC 13818-1
- Boot-time display using minimum resources

Platform Management Unit (PMU)

- Performs system initialization during boot
- Acts as a delegate to the application and real-time processors during sleep state
- Initiates power-up and restart after the wake-up request
- Maintains the system power state at all time
- Manages the sequence of low-level events required for power-up, power-down, reset, clock gating, and power gating of islands and domains
- Provides error management (error handling and reporting)
- Provides safety check functions (e.g., memory scrubbing)

The PMU includes the following blocks:

- Platform management processor
- Fixed ROM for boot-up of the device
- 128KB RAM with ECC for optional user/firmware code
- Local and global registers to manage power-down, power-up, reset, clock gating, and power gating requests
- Interrupt controller with 16 interrupts from other modules and the inter-processor communication interface (IPI)
- GPI and GPO interfaces to and from PS I/O and PL
- JTAG interface for PMU debug
- Optional User-Defined Firmware

- 2 chip selects
- Programmable access timing
- 1.8V and 3.3V I/O
- Built-in DMA for improved performance

Quad-SPI Controller

- 4 bytes (32-bit) and 3 bytes (24-bit) address width
- Maximum SPI Clock at Master Mode at 150MHz
- Single, Dual-Parallel, and Dual-Stacked mode
- 32-bit AXI Linear Address Mapping Interface for read operation
- Up to 2 chip select signals
- Write Protection Signal
- Hold signals
- 4-bit bidirectional I/O signals
- x1/x2/x4 Read speed required
- x1 write speed required only
- 64 byte Entry FIFO depth to improve QSPI read efficiency
- Built-in DMA for improved performance

Video Encoder/Decoder (VCU)

Zynq UltraScale+ MPSoCs include a Video codec (encoder/decoder) available in the devices designated with the EV suffix. The VCU is located in the PL and can be accessed from either the PL or PS.

- Simultaneous Encode and Decode through separate cores
- H.264 high profile level 5.2 (4Kx2K-60)
- H.265 (HEVC) main, main10 profile, level 5.1, high Tier, up to 4Kx2K-60 rate
- 8 and 10 bit encoding
- 4:2:0 and 4:2:2 chroma sampling
- 8Kx4K-15 rate
- Multi-stream up to total of 4Kx2K-60 rate
- Low Latency mode
- Can share the PS DRAM or use dedicated DRAM in the PL
- Clock/power management
- OpenMax Linux drivers

Table 8: **MIO Peripheral Interface Mapping**

Peripheral Interface	MIO	EMIO
Quad-SPI NAND	Yes	No
USB2.0: 0,1	Yes: External PHY	No
SDIO 0,1	Yes	Yes
SPI: 0,1 I2C: 0,1 CAN: 0,1 GPIO	Yes CAN: External PHY GPIO: Up to 78 bits	Yes CAN: External PHY GPIO: Up to 96 bits
GigE: 0,1,2,3	RGMII v2.0: External PHY	Supports GMII, RGMII v2.0 (HSTL), RGMII v1.3, MII, SGMII, and 1000BASE-X in Programmable Logic
UART: 0,1	Simple UART: Only two pins (TX and RX)	Full UART (TX, RX, DTR, DCD, DSR, RI, RTS, and CTS) requires either: • Two Processing System (PS) pins (RX and TX) through MIO and six additional Programmable Logic (PL) pins, *or* • Eight Programmable Logic (PL) pins
Debug Trace Ports	Yes: Up to 16 trace bits	Yes: Up to 32 trace bits
Processor JTAG	Yes	Yes

Transceiver (PS-GTR)

The four PS-GTR transceivers, which reside in the full power domain (FPD), support data rates of up to 6.0Gb/s. All the protocols cannot be pinned out at the same time. At any given time, four differential pairs can be pinned out using the transceivers. This is user programmable via the high-speed I/O multiplexer (HS-MIO).

- A Quad transceiver PS-GTR (TX/RX pair) able to support following standards simultaneously
  - x1, x2, or x4 lane of PCIe at Gen1 (2.5Gb/s) or Gen2 (5.0Gb/s) rates
  - 1 or 2 lanes of DisplayPort (TX only) at 1.62Gb/s, 2.7Gb/s, or 5.4Gb/s
  - 1 or 2 SATA channels at 1.5Gb/s, 3.0Gb/s, or 6.0Gb/s
  - 1 or 2 USB3.0 channels at 5.0Gb/s
  - 1-4 Ethernet SGMII channels at 1.25Gb/s
- Provides flexible host-programmable multiplexing function for connecting the transceiver resources to the PS masters (DisplayPort, PCIe, Serial-ATA, USB3.0, and GigE).

HS-MIO

The function of the HS-MIO is to multiplex access from the high-speed PS peripheral to the differential pair on the PS-GTR transceiver as defined in the configuration registers. Up to 4 channels of the transceiver are available for use by the high-speed interfaces in the PS.

Table 9: **HS-MIO Peripheral Interface Mapping**

Peripheral Interface	Lane0	Lane1	Lane2	Lane3
PCIe (x1, x2 or x4)	PCIe0	PCIe1	PCIe2	PCIe3
SATA (1 or 2 channels)	SATA0	SATA1	SATA0	SATA1
DisplayPort (TX only)	DP1	DP0	DP1	DP0
USB0	USB0	USB0	USB0	–
USB1	–	–	–	USB1
SGMII0	SGMII0	–	–	–
SGMII1	–	SGMII1	–	–
SGMII2	–	–	SGMII2	–
SGMII3	–	–	–	SGMII3

PS-PL Interface

The PS-PL interface includes:

- AMBA AXI4 interfaces for primary data communication
  - Six 128-bit/64-bit/32-bit High Performance (HP) Slave AXI interfaces from PL to PS.
    - Four 128-bit/64-bit/32-bit HP AXI interfaces from PL to PS DDR.
    - Two 128-bit/64-bit/32-bit high-performance coherent (HPC) ports from PL to cache coherent interconnect (CCI).
  - Two 128-bit/64-bit/32-bit HP Master AXI interfaces from PS to PL.
  - One 128-bit/64-bit/32-bit interface from PL to RPU in PS (PL_LPD) for low latency access to OCM.
  - One 128-bit/64-bit/32-bit AXI interface from RPU in PS to PL (LPD_PL) for low latency access to PL.
  - One 128-bit AXI interface (ACP port) for I/O coherent access from PL to Cortex-A53 cache memory. This interface provides coherency in hardware for Cortex-A53 cache memory.
  - One 128-bit AXI interface (ACE Port) for Fully coherent access from PL to Cortex-A53. This interface provides coherency in hardware for Cortex-A53 cache memory and the PL.
- Clocks and resets
  - Four PS clock outputs to the PL with start/stop control.
  - Four PS reset outputs to the PL.

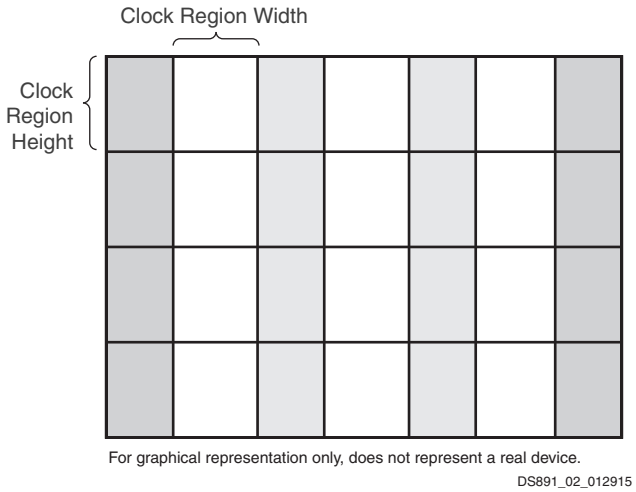

Figure 2: **Column-Based Device Divided into Clock Regions**

Input/Output

All Zynq UltraScale+ MPSoCs have I/O pins for communicating to external components. In addition, in the MPSoC's PS, there are another 78 I/Os that the I/O peripherals use to communicate to external components, referred to as multiplexed I/O (MIO). If more than 78 pins are required by the I/O peripherals, the I/O pins in the PL can be used to extend the MPSoC interfacing capability, referred to as extended MIO (EMIO).

The number of I/O pins in the PL of Zynq UltraScale+ MPSoCs varies depending on device and package. Each I/O is configurable and can comply with a large number of I/O standards. The I/Os are classed as high-performance (HP), or high-density (HD). The HP I/Os are optimized for highest performance operation, from 1.0V to 1.8V. The HD I/Os are reduced-feature I/Os organized in banks of 24, providing voltage support from 1.2V to 3.3V.

All I/O pins are organized in banks, with 52 HP pins per bank or 24 HD pins per bank. Each bank has one common V_{CCO} output buffer power supply, which also powers certain input buffers. Some single-ended input buffers require an internally generated or an externally applied reference voltage (V_{REF}). V_{REF} pins can be driven directly from the PCB or internally generated using the internal V_{REF} generator circuitry present in each bank.

I/O Electrical Characteristics

Single-ended outputs use a conventional CMOS push/pull output structure driving High towards V_{CCO} or Low towards ground, and can be put into a high-Z state. The system designer can specify the slew rate and the output strength. The input is always active but is usually ignored while the output is active. Each pin can optionally have a weak pull-up or a weak pull-down resistor.

Most signal pin pairs can be configured as differential input pairs or output pairs. Differential input pin pairs can optionally be terminated with a 100Ω internal resistor. All UltraScale architecture-based devices support differential standards beyond LVDS, including RSDS, BLVDS, differential SSTL, and differential HSTL. Each of the I/Os supports memory I/O standards, such as single-ended and differential HSTL as well as single-ended and differential SSTL. The Zynq UltraScale+ family includes support for MIPI with a dedicated D-PHY in the I/O bank.

3-State Digitally Controlled Impedance and Low Power I/O Features

The 3-state Digitally Controlled Impedance (T_DCI) can control the output drive impedance (series termination) or can provide parallel termination of an input signal to V_{CCO} or split (Thevenin) termination to $V_{CCO}/2$. This allows users to eliminate off-chip termination for signals using T_DCI. In addition to board space savings, the termination automatically turns off when in output mode or when 3-stated, saving considerable power compared to off-chip termination. The I/Os also have low power modes for IBUF and IDELAY to provide further power savings, especially when used to implement memory interfaces.

I/O Logic

Input and Output Delay

All inputs and outputs can be configured as either combinatorial or registered. Double data rate (DDR) is supported by all inputs and outputs. Any input or output can be individually delayed by up to 1,250ps of delay with a resolution of 5–15ps. Such delays are implemented as IDELAY and ODELAY. The number of delay steps can be set by configuration and can also be incremented or decremented while in use. The IDELAY and ODELAY can be cascaded together to double the amount of delay in a single direction.

ISERDES and OSERDES

Many applications combine high-speed, bit-serial I/O with slower parallel operation inside the device. This requires a serializer and deserializer (SerDes) inside the I/O logic. Each I/O pin possesses an IOSERDES (ISERDES and OSERDES) capable of performing serial-to-parallel or parallel-to-serial conversions with programmable widths of 2, 4, or 8 bits. These I/O logic features enable high-performance interfaces, such as Gigabit Ethernet/1000BaseX/SGMII, to be moved from the transceivers to the SelectIO interface.

High-Speed Serial Transceivers

Ultra-fast serial data transmission between devices on the same PCB, over backplanes, and across even longer distances is becoming increasingly important for scaling to 100 Gb/s and 400 Gb/s line cards. Specialized dedicated on-chip circuitry and differential I/O capable of coping with the signal integrity issues are required at these high data rates.

Three types of transceivers are used in Zynq UltraScale+ MPSoCs: GTH, GTY, and PS-GTR. All transceivers are arranged in groups of four, known as a transceiver Quad. Each serial transceiver is a combined transmitter and receiver. Table 10 compares the available transceivers.

Out-of-Band Signaling

The transceivers provide out-of-band (OOB) signaling, often used to send low-speed signals from the transmitter to the receiver while high-speed serial data transmission is not active. This is typically done when the link is in a powered-down state or has not yet been initialized. This benefits PCIe and SATA/SAS and QPI applications.

Integrated Interface Blocks for PCI Express Designs

The MPSoC PL includes integrated blocks for PCIe technology that can be configured as an Endpoint or Root Port, compliant to the PCI Express Base Specification Revision 3.1 for Gen3 and lower data rates and compatible with the PCI Express Base Specification Revision 4.0 (rev 0.5) for Gen4 data rates. The Root Port can be used to build the basis for a compatible Root Complex, to allow custom chip-to-chip communication via the PCI Express protocol, and to attach ASSP Endpoint devices, such as Ethernet Controllers or Fibre Channel HBAs, to the MPSoC.

This block is highly configurable to system design requirements and can operate 1, 2, 4, 8, or 16 lanes at up to 2.5Gb/s, 5.0Gb/s, 8.0Gb/s, or 16Gb/s data rates. For high-performance applications, advanced buffering techniques of the block offer a flexible maximum payload size of up to 1,024 bytes. The integrated block interfaces to the integrated high-speed transceivers for serial connectivity and to block RAMs for data buffering. Combined, these elements implement the Physical Layer, Data Link Layer, and Transaction Layer of the PCI Express protocol.

Xilinx provides a light-weight, configurable, easy-to-use LogiCORE™ IP wrapper that ties the various building blocks (the integrated block for PCIe, the transceivers, block RAM, and clocking resources) into an Endpoint or Root Port solution. The system designer has control over many configurable parameters: link width and speed, maximum payload size, MPSoC logic interface speeds, reference clock frequency, and base address register decoding and filtering.

Integrated Block for Interlaken

Some UltraScale architecture-based devices include integrated blocks for Interlaken. Interlaken is a scalable chip-to-chip interconnect protocol designed to enable transmission speeds from 10Gb/s to 150Gb/s. The Interlaken integrated block in the UltraScale architecture is compliant to revision 1.2 of the Interlaken specification with data striping and de-striping across 1 to 12 lanes. Permitted configurations are: 1 to 12 lanes at up to 12.5Gb/s and 1 to 6 lanes at up to 25.78125Gb/s, enabling flexible support for up to 150Gb/s per integrated block. With multiple Interlaken blocks, certain UltraScale architecture-based devices enable easy, reliable Interlaken switches and bridges.

PLL

With fewer features than the MMCM, the two PLLs in a clock management tile are primarily present to provide the necessary clocks to the dedicated memory interface circuitry. The circuit at the center of the PLLs is similar to the MMCM, with PFD feeding a VCO and programmable M, D, and O counters. There are two divided outputs to the device fabric per PLL as well as one clock plus one enable signal to the memory interface circuitry.

Zynq UltraScale+ MPSoCs are equipped with five additional PLLs in the PS for independently configuring the four primary clock domains with the PS: the APU, the RPU, the DDR controller, and the I/O peripherals.

Clock Distribution

Clocks are distributed throughout Zynq UltraScale+ MPSoCs via buffers that drive a number of vertical and horizontal tracks. There are 24 horizontal clock routes per clock region and 24 vertical clock routes per clock region with 24 additional vertical clock routes adjacent to the MMCM and PLL. Within a clock region, clock signals are routed to the device logic (CLBs, etc.) via 16 gateable leaf clocks.

Several types of clock buffers are available. The BUFGCE and BUFCE_LEAF buffers provide clock gating at the global and leaf levels, respectively. BUFGCTRL provides glitchless clock muxing and gating capability. BUFGCE_DIV has clock gating capability and can divide a clock by 1 to 8. BUFG_GT performs clock division from 1 to 8 for the transceiver clocks. In MPSoCs, clocks can be transferred from the PS to the PL using dedicated buffers.

Memory Interfaces

Memory interface data rates continue to increase, driving the need for dedicated circuitry that enables high performance, reliable interfacing to current and next-generation memory technologies. Every Zynq UltraScale+ MPSoC includes dedicated physical interfaces (PHY) blocks located between the CMT and I/O columns that support implementation of high-performance PHY blocks to external memories such as DDR4, DDR3, QDRII+, and RLDRAM3. The PHY blocks in each I/O bank generate the address/control and data bus signaling protocols as well as the precision clock/data alignment required to reliably communicate with a variety of high-performance memory standards. Multiple I/O banks can be used to create wider memory interfaces.

As well as external parallel memory interfaces, Zynq UltraScale+ MPSoC can communicate to external serial memories, such as Hybrid Memory Cube (HMC), via the high-speed serial transceivers. All transceivers in the UltraScale architecture support the HMC protocol, up to 15Gb/s line rates. UltraScale architecture-based devices support the highest bandwidth HMC configuration of 64 lanes with a single device.

Configurable Logic Block

Every Configurable Logic Block (CLB) in the UltraScale architecture contains 8 LUTs and 16 flip-flops. The LUTs can be configured as either one 6-input LUT with one output, or as two 5-input LUTs with separate outputs but common inputs. Each LUT can optionally be registered in a flip-flop. In addition to the LUTs and flip-flops, the CLB contains arithmetic carry logic and multiplexers to create wider logic functions.

Each CLB contains one slice. There are two types of slices: SLICEL and SLICEM. LUTs in the SLICEM can be configured as 64-bit RAM, as 32-bit shift registers (SRL32), or as two SRL16s. CLBs in the UltraScale architecture have increased routing and connectivity compared to CLBs in previous-generation Xilinx devices. They also have additional control signals to enable superior register packing, resulting in overall higher device utilization.

Interconnect

Various length vertical and horizontal routing resources in the UltraScale architecture that span 1, 2, 4, 5, 12, or 16 CLBs ensure that all signals can be transported from source to destination with ease, providing support for the next generation of wide data buses to be routed across even the highest capacity devices while simultaneously improving quality of results and software run time.

Block RAM

Every UltraScale architecture-based device contains a number of 36Kb block RAMs, each with two completely independent ports that share only the stored data. Each block RAM can be configured as one 36Kb RAM or two independent 18Kb RAMs. Each memory access, read or write, is controlled by the clock. Connections in every block RAM column enable signals to be cascaded between vertically adjacent block RAMs, providing an easy method to create large, fast memory arrays, and FIFOs with greatly reduced power consumption.

All inputs, data, address, clock enables, and write enables are registered. The input address is always clocked (unless address latching is turned off), retaining data until the next operation. An optional output data pipeline register allows higher clock rates at the cost of an extra cycle of latency. During a write operation, the data output can reflect either the previously stored data or the newly written data, or it can remain unchanged. Block RAM sites that remain unused in the user design are automatically powered down to reduce total power consumption. There is an additional pin on every block RAM to control the dynamic power gating feature.

In FPGAs and the MPSoC PL, sensor outputs and up to 17 user-allocated external analog inputs are digitized using a 10-bit 200 kilo-sample-per-second (kSPS) ADC, and the measurements are stored in registers that can be accessed via internal FPGA (DRP), JTAG, PMBus, or I2C interfaces. The I2C interface and PMBus allow the on-chip monitoring to be easily accessed by the System Manager/Host before and after device configuration.

The System Monitor in the MPSoC PS uses a 10-bit, 1 mega-sample-per-second (MSPS) ADC to digitize the sensor inputs. The measurements are stored in registers and are accessed via the Advanced Peripheral Bus (APB) interface by the processors and the PMU in the PS.

Packaging

The UltraScale architecture-based devices are available in a variety of organic flip-chip and lidless flip-chip packages supporting different quantities of I/Os and transceivers. Maximum supported performance can depend on the style of package and its material. Always refer to the specific device data sheet for performance specifications by package type.

In flip-chip packages, the silicon device is attached to the package substrate using a high-performance flip-chip process. Decoupling capacitors are mounted on the package substrate to optimize signal integrity under simultaneous switching of outputs (SSO) conditions.

System-Level Features

Several functions span both the PS and PL and include:

- Reset Management
- Clock Management
- Power Domains
- PS Boot and Device Configuration
- Hardware and Software Debug Support

Reset Management

The reset management function provides the ability to reset the entire device or individual units within it. The PS supports these reset functions and signals:

- External and internal power-on reset signal
- Warm reset
- Watchdog timer reset
- User resets to PL
- Software, watchdog timer, or JTAG provided resets
- Security violation reset (locked down reset)
