Embedded - Microcontrollers - Application Specific: Tailored Solutions for Precision and Performance

#### Embedded - Microcontrollers - Application Specific

represents a category of microcontrollers designed with unique features and capabilities tailored to specific application needs. Unlike general-purpose microcontrollers, application-specific microcontrollers are optimized for particular tasks, offering enhanced performance, efficiency, and functionality to meet the demands of specialized applications.

#### What Are <u>Embedded - Microcontrollers -</u> <u>Application Specific</u>?

Application enacific microcontrollars are angineered to

#### Details

Product Status	Obsolete
Applications	USB Hub/Microcontroller
Core Processor	M8
Program Memory Type	OTP (8kB)
Controller Series	USB Hub
RAM Size	256 x 8
Interface	USB
Number of I/O	4
Voltage - Supply	4V ~ 5.5V
Operating Temperature	0°C ~ 70°C
Mounting Type	Surface Mount
Package / Case	28-SOIC (0.295", 7.50mm Width)
Supplier Device Package	28-SOIC
Purchase URL	https://www.e-xfl.com/product-detail/infineon-technologies/cy7c65100-sc

Email: info@E-XFL.COM

Address: Room A, 16/F, Full Win Commercial Centre, 573 Nathan Road, Mongkok, Hong Kong

# CY7C65100 Four-port Universal Serial Bus Fixed-function Hub Controller

## 1.0 Features

- Fixed-function four-port USB hub devices with integrated hub repeater, hub controller, Serial Interface Engine (SIE), and USB transceivers
- USB Specification Compliance
  - Conforms to USB Specification, Rev. 1.1
  - Complies with the USB HUB Device Class
- · Supports self-powered and bus-powered applications
- · Individual downstream port power switching
- Individual downstream port overcurrent detection
- Integrated USB transceivers reduce EMI
- Internal 48-MHz phase-locked loop (PLL) reduces design cost by requiring only an external 6-MHz crystal
- Operating voltage from 4.0V-5.5V DC
- Operating temperature from 0°–70° Celsius
- Available in a space-saving 28-lead SOIC package

#### 2.0 Functional Overview

The CY7C65100 series offers high-performance fixed-function Universal Serial Bus (USB) hub devices that comply with USB Specification, Rev. 1.1. Up to four downstream USB ports are available to expand the USB attachment points available in your PC system. These self-contained devices require no firmware development for your design, thereby reducing the design risk associated with some microcontroller solutions. These Application Specific Standard Products (ASSP) can improve time-to-market in a number of USB designs, including standalone hubs, motherboard hubs, and monitor hubs.

The CY7C65100 series supports self-powered or bus-powered applications. Power management for all downstream ports supports power-switching and overcurrent detection with individual port control. The four downstream ports support both full-speed (12-Mbps signaling rate) and low-speed (1.5-Mbps signaling rate) devices. The CY7C65100 series has a reduced frequency (6-MHz) crystal oscillator for lower system cost as well as improved EMI performance. The four-port CY7C65100 series is available in a cost-effective and space-saving 28-lead SOIC package.

## 3.0 Product Summary

#### 3.3 Pin Assignments

#### Table 3-1. Pin Assignments

Name	I/O	Pin	Description
D+[0], D–[0]	I/O	5,6	Upstream port, USB differential data
D+[1], D–[1]	I/O	7,8	Downstream port 1, USB differential data
D+[2], D–[2]	I/O	9,10	Downstream port 2, USB differential data
D+[3], D–[3]	I/O	23,24	Downstream port 3, USB differential data
D+[4], D–[4]	I/O	21,22	Downstream port 4, USB differential data
PWR[1]- PWR[4]	OUT	18,14,17,13 Downstream port power enable output	
OC[1]-OC[4]	IN	16,12,15,11 Downstream port power over-current detection signals	
XTALIN	IN	2 6-MHz crystal or external clock input	
XTALOUT	OUT	1 6-MHz crystal out	
V <sub>CC</sub>	PWR	28	Voltage supply
GND	GND	4,19,20 Ground	
V <sub>REF</sub>	IN	3	Input for external 3.3V supply voltage for the upstream and down- stream differential data output buffers and the D+ pull-up
PWR_SEL	IN	25	Bus or self-power function select input
PSTAT[1/2], PSTAT[3/4]	OUT	26,27	Downstream port LED status enable

#### 4.0 Clocking

XTALIN and XTALOUT are the clock pins to the CY7C65100 series. The user can connect either an external oscillator or a crystal to these pins. A 6-MHz fundamental crystal can be connected to these pins to provide a reference frequency for the internal PLL. When using an external crystal, keep PCB traces between the chip leads and crystal as short as possible (less than 2 cm). A ceramic resonator is not an adequate clock source to meet the timing specifications of a high-speed USB function and therefore cannot be used with these parts. An external 6-MHz clock can be applied to the XTALIN pin if the XTALOUT pin is left open. Please note that grounding the XTALOUT pin when driving XTALIN with an oscillator will not work as the internal clock is effectively shorted to ground.

## 5.0 USB Overview

The USB hardware includes a USB Hub repeater with one upstream port and up to four downstream ports. An external series resistor of  $R_{ext} = 20\Omega (\pm 5\%)$  must be placed in series with all upstream and downstream USB I/O in order to meet the USB driver impedance requirements as defined by the USB specification (see *Figure 6-1*).

#### 5.1 USB SIE

The SIE allows the CY7C65100 series to communicate with the USB host through the USB repeater portion of the hub. The SIE handles the following USB bus activity independently of the hub microcontroller:

- Bit stuffing/unstuffing
- Checksum generation/checking

- ACK/NAK/STALL
- TOKEN type identification
- Address checking.
- The following protocol handling is done at a higher level by the Hub Control Block:
- Coordinate enumeration by responding to SETUP packets
- Fill and empty the FIFOs
- Suspend/Resume coordination
- Verify and select DATA toggle values
- Port power control and over-current detection.

#### 5.2 Hub Design

The power switching and over-current detection of downstream ports is managed by control pins connected to an external power switch device (see *Figure 6-1*). The active-LOW PWR[n] output pins of the CY7C65100 series are connected to the respective external power switch's port power enable signals. (Note that each port power output pin of the external power switch must be bypassed with an electrolytic or tantalum capacitor as required by the USB specification. These capacitors supply the inrush currents which occur during downstream device hot-attach events.) The active-LOW  $\overline{OC[n]}$  pins of the CY7C65100 series are connected to the respective external power switch's port over-current indication (output) signals. Upon detecting an over-current condition, the hub device reports the over-current condition to the host and disables (sets to logic HIGH) the respective  $\overline{PWR[n]}$  signal connected to the external power device.

## 5.3 Vendor ID and Product ID

The CY7C65100 Series will enumerate with the default Vendor ID and Product ID as follows.

	Bus-powered	Self-powered
Vendor ID	0x04b4	0x04b4
Product ID	0x5204	0x5203

Pin 25 (PWR\_SEL) is a strapping option that selects the device's power configuration report (PWR\_SEL = GND for self-powered, PWR\_SEL = Vcc for bus-powered).

For high-volume business, Cypress has the capability to factory-program a Custom Vendor ID and Product ID. Please contact your local Cypress sales office for more information.
