What is "Embedded - Microcontrollers"?

"Embedded - Microcontrollers" refer to small, integrated circuits designed to perform specific tasks within larger systems. These microcontrollers are essentially compact computers on a single chip, containing a processor core, memory, and programmable input/output peripherals. They are called "embedded" because they are embedded within electronic devices to control various functions, rather than serving as standalone computers. Microcontrollers are crucial in modern electronics, providing the intelligence and control needed for a wide range of applications.

- Enhanced Framed SPI protocol support
- User-configurable 8-bit, 16-bit and 32-bit data width
- Separate SPI FIFO buffers for receive and transmit
  - FIFO buffers act as 4/8/16-level deep FIFOs based on 32/16/8-bit data width
- Programmable interrupt event on every 8-bit, 16-bit and 32-bit data transfer

22.0 REAL-TIME CLOCK AND CALENDAR (RTCC)

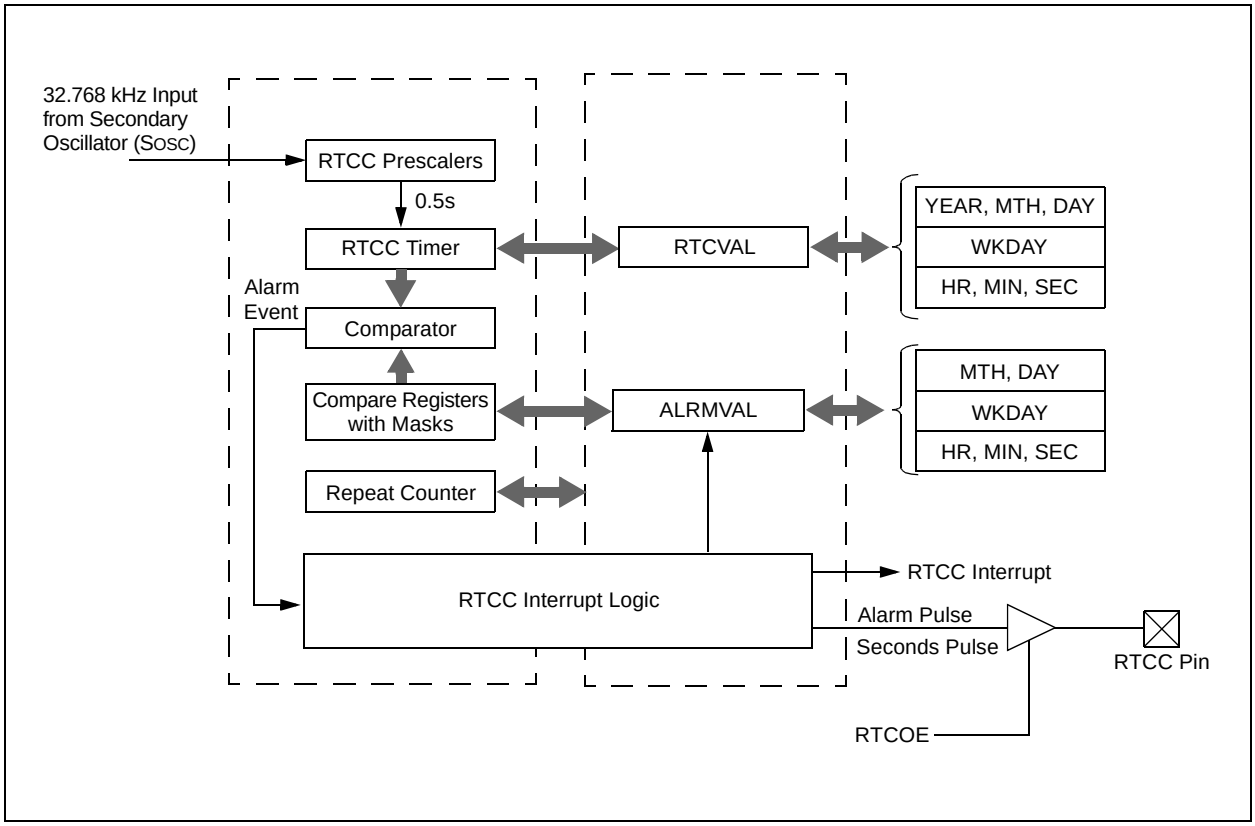
Note:	This data sheet summarizes the features of the PIC32MX5XX/6XX/7XX family of devices. It is not intended to be a comprehensive reference source. To complement the information in this data sheet, refer to **Section 29. "Real-Time Clock and Calendar (RTCC)"** (DS60001125) in the *"PIC32 Family Reference Manual"*, which is available from the Microchip web site (www.microchip.com/PIC32).

The PIC32 RTCC module is intended for applications in which accurate time must be maintained for extended periods of time with minimal or no CPU intervention. Low-power optimization provides extended battery lifetime while keeping track of time. A simplified block diagram of the RTCC module is illustrated in Figure 22-1.

Key features of the RTCC module include:

- Time: hours, minutes and seconds
- 24-hour format (military time)
- Visibility of one-half second period
- Provides calendar: Weekday, date, month and year
- Alarm intervals are configurable for half of a second, one second, 10 seconds, one minute, 10 minutes, one hour, one day, one week, one month and one year
- Alarm repeat with decrementing counter
- Alarm with indefinite repeat: Chime
- Year range: 2000 to 2099
- Leap year correction
- BCD format for smaller firmware overhead
- Optimized for long-term battery operation
- Fractional second synchronization
- User calibration of the clock crystal frequency with auto-adjust
- Calibration range: ±0.66 seconds error per month
- Calibrates up to 260 ppm of crystal error
- Requirements: External 32.768 kHz clock crystal
- Alarm pulse or seconds clock output on RTCC pin

FIGURE 22-1: RTCC BLOCK DIAGRAM



REGISTER 22-1: RTCCON: RTC CONTROL REGISTER (CONTINUED)

bit 3 **RTCWREN:** RTC Value Registers Write Enable bit(4)
- 1 = RTC Value registers can be written to by the user
- 0 = RTC Value registers are locked out from being written to by the user

bit 2 **RTCSYNC:** RTCC Value Registers Read Synchronization bit
- 1 = RTC Value registers can change while reading, due to a rollover ripple that results in an invalid data read. If the register is read twice and results in the same data, the data can be assumed to be valid.
- 0 = RTC Value registers can be read without concern about a rollover ripple

bit 1 **HALFSEC:** Half-Second Status bit(5)
- 1 = Second half period of a second
- 0 = First half period of a second

bit 0 **RTCOE:** RTCC Output Enable bit
- 1 = RTCC clock output is enabled (clock presented onto an I/O)
- 0 = RTCC clock output is disabled

Note 1: The ON bit is only writable when RTCWREN = 1.

2: When using the 1:1 PBCLK divisor, the user's software should not read/write the peripheral's SFRs in the SYSCLK cycle immediately following the instruction that clears the module's ON bit.

3: Requires RTCOE = 1 (RTCCON<0>) for the output to be active.

4: The RTCWREN bit can only be set when the write sequence is enabled.

5: This bit is read-only. It is cleared to '0' on a write to the seconds bit fields (RTCTIME<14:8>).

Note:	This register is only reset on a Power-on Reset (POR).

bit 15 **ALRMEN:** Alarm Enable bit(1,2)
- 1 = Alarm is enabled
- 0 = Alarm is disabled

bit 14 **CHIME:** Chime Enable bit(2)
- 1 = Chime is enabled – ARPT<7:0> is allowed to rollover from 0x00 to 0xFF
- 0 = Chime is disabled – ARPT<7:0> stops once it reaches 0x00

bit 13 **PIV:** Alarm Pulse Initial Value bit(3)
When ALRMEN = 0, PIV is writable and determines the initial value of the Alarm Pulse.
When ALRMEN = 1, PIV is read-only and returns the state of the Alarm Pulse.

bit 12 **ALRMSYNC:** Alarm Sync bit(3)
- 1 = ARPT<7:0> and ALRMEN may change as a result of a half second rollover during a read. The ARPT must be read repeatedly until the same value is read twice. This must be done since multiple bits may be changing, which are then synchronized to the PB clock domain.
- 0 = ARPT<7:0> and ALRMEN can be read without concerns of rollover because the prescaler is > 32 RTC clocks away from a half-second rollover

- 0100 = Every 10 minutes
- 0011 = Every minute
- 0010 = Every 10 seconds
- 0001 = Every second
- 0000 = Every half-second

Note 1: Hardware clears the ALRMEN bit anytime the alarm event occurs, when ARPT<7:0> = 00 and CHIME = 0.

2: This field should not be written when the RTCC ON bit = '1' (RTCCON<15>) and ALRMSYNC = 1.

3: This assumes a CPU read will execute in less than 32 PBCLKs.

Note: This register is only reset on a Power-on Reset (POR).

Voltage on any 5V tolerant pin with respect to V_{SS} when $V_{DD} < 2.3V$ **(Note 3)** ..... -0.3V to +3.6V
Voltage on V_{BUS} with respect to V_{SS} ..... -0.3V to +5.5V
Maximum current out of V_{SS} pin(s) ..... 300 mA
Maximum current into V_{DD} pin(s) **(Note 2)** ..... 300 mA
Maximum output current sunk by any I/O pin ..... 25 mA
Maximum output current sourced by any I/O pin ..... 25 mA
Maximum current sunk by all ports ..... 200 mA
Maximum current sourced by all ports **(Note 2)** ..... 200 mA

Note 1: Stresses above those listed under **"Absolute Maximum Ratings"** may cause permanent damage to the device. This is a stress rating only and functional operation of the device at those or any other conditions, above those indicated in the operation listings of this specification, is not implied. Exposure to maximum rating conditions for extended periods may affect device reliability.

2: Maximum allowable current is a function of device maximum power dissipation (see Table 32-2).

3: See the **"Device Pin Tables"** section for the 5V tolerant pins.
