

Welcome to [E-XFL.COM](http://E-XFL.COM)

### What is "[Embedded - Microcontrollers](#)"?

"[Embedded - Microcontrollers](#)" refer to small, integrated circuits designed to perform specific tasks within larger systems. These microcontrollers are essentially compact computers on a single chip, containing a processor core, memory, and programmable input/output peripherals. They are called "embedded" because they are embedded within electronic devices to control various functions, rather than serving as standalone computers. Microcontrollers are crucial in modern electronics, providing the intelligence and control needed for a wide range of applications.

### Applications of "[Embedded - Microcontrollers](#)"

Details	
Product Status	Active
Core Processor	MIPS32® M4K™
Core Size	32-Bit Single-Core
Speed	80MHz
Connectivity	CANbus, Ethernet, I <sup>2</sup> C, SPI, UART/USART, USB OTG
Peripherals	Brown-out Detect/Reset, DMA, POR, PWM, WDT
Number of I/O	53
Program Memory Size	256KB (256K x 8)
Program Memory Type	FLASH
EEPROM Size	-
RAM Size	64K x 8
Voltage - Supply (Vcc/Vdd)	2.3V ~ 3.6V
Data Converters	A/D 16x10b
Oscillator Type	Internal
Operating Temperature	-40°C ~ 85°C (TA)
Mounting Type	Surface Mount
Package / Case	64-VFQFN Exposed Pad
Supplier Device Package	64-VQFN (9x9)
Purchase URL	<a href="https://www.e-xfl.com/product-detail/microchip-technology/pic32mx775f256ht-80i-mr">https://www.e-xfl.com/product-detail/microchip-technology/pic32mx775f256ht-80i-mr</a>

23:16	U-0 —	U-0 —	U-0 —	U-0 —	U-0 —	U-0 —	U-0 —	U-0 —
15:8	R/W-0, HC WR	R/W-0 WREN	R-0, HS WRERR <sup>(1)</sup>	R-0, HS LVDERR <sup>(1)</sup>	R-0, HSC LVDSTAT <sup>(1)</sup>	U-0 —	U-0 —	U-0 —
7:0	U-0 —	U-0 —	U-0 —	U-0 —	R/W-0	NVMOP<3:0> R/W-0 R/W-0 R/W-0		

<b>Legend:</b>	U = Unimplemented bit, read as '0'	HSC = Set and Cleared by hardware
R = Readable bit	W = Writable bit	HS = Set by hardware
-n = Value at POR	'1' = Bit is set	'0' = Bit is cleared
		x = Bit is unknown

bit 31-16 **Unimplemented:** Read as '0'

bit 15 **WR:** Write Control bit

This bit is writable when WREN = 1 and the unlock sequence is followed.

1 = Initiate a Flash operation. Hardware clears this bit when the operation completes

0 = Flash operation complete or inactive

bit 14 **WREN:** Write Enable bit

1 = Enable writes to WR bit and enables LVD circuit

0 = Disable writes to WR bit and disables LVD circuit

**Note:** This is the only bit in this register that is reset by a device Reset.

bit 13 **WRERR:** Write Error bit<sup>(1)</sup>

This bit is read-only and is automatically set by hardware.

1 = Program or erase sequence did not complete successfully

0 = Program or erase sequence completed normally

bit 12 **LVDERR:** Low-Voltage Detect Error bit (LVD circuit must be enabled)<sup>(1)</sup>

This bit is read-only and is automatically set by hardware.

1 = Low-voltage detected (possible data corruption, if WRERR is set)

0 = Voltage level is acceptable for programming

bit 11 **LVDSTAT:** Low-Voltage Detect Status bit (LVD circuit must be enabled)<sup>(1)</sup>

This bit is read-only and is automatically set, and cleared, by hardware.

1 = Low-voltage event is active

0 = Low-voltage event is not active

bit 10-4 **Unimplemented:** Read as '0'

bit 3-0 **NVMOP<3:0>:** NVM Operation bits

These bits are writable when WREN = 0.

1111 = Reserved

•  
•  
•

0111 = Reserved

0110 = No operation

0101 = Program Flash (PFM) erase operation: erases PFM if all pages are not write-protected

0100 = Page erase operation: erases page selected by NVMADDR if it is not write-protected

0011 = Row program operation: programs row selected by NVMADDR if it is not write-protected

0010 = No operation

0001 = Word program operation: programs word selected by NVMADDR if it is not write-protected

0000 = No operation

**Note 1:** This bit is cleared by setting NVMOP == 0000b, and initiating a Flash operation (i.e., WR).

## REGISTER 7-6: IPCx: INTERRUPT PRIORITY CONTROL REGISTER (CONTINUED)

bit 12-10 **IP01<2:0>**: Interrupt Priority bits

111 = Interrupt priority is 7

•  
•  
•

010 = Interrupt priority is 2

001 = Interrupt priority is 1

000 = Interrupt is disabled

bit 9-8 **IS01<1:0>**: Interrupt Sub-priority bits

11 = Interrupt sub-priority is 3

10 = Interrupt sub-priority is 2

01 = Interrupt sub-priority is 1

00 = Interrupt sub-priority is 0

bit 7-5 **Unimplemented**: Read as '0'

bit 4-2 **IP00<2:0>**: Interrupt Priority bits

111 = Interrupt priority is 7

•  
•  
•

010 = Interrupt priority is 2

001 = Interrupt priority is 1

000 = Interrupt is disabled

bit 1-0 **IS00<1:0>**: Interrupt Sub-priority bits

11 = Interrupt sub-priority is 3

10 = Interrupt sub-priority is 2

01 = Interrupt sub-priority is 1

00 = Interrupt sub-priority is 0

**Note:** This register represents a generic definition of the IPCx register. Refer to Table 7-1 for the exact bit definitions.

# PIC32MX5XX/6XX/7XX

## REGISTER 8-1: OSCCON: OSCILLATOR CONTROL REGISTER (CONTINUED)

bit 18-16 **PLLMULT<2:0>**: Phase-Locked Loop (PLL) Multiplier bits

- 111 = Clock is multiplied by 24
- 110 = Clock is multiplied by 21
- 101 = Clock is multiplied by 20
- 100 = Clock is multiplied by 19
- 011 = Clock is multiplied by 18
- 010 = Clock is multiplied by 17
- 001 = Clock is multiplied by 16
- 000 = Clock is multiplied by 15

bit 15 **Unimplemented**: Read as '0'

bit 14-12 **COSC<2:0>**: Current Oscillator Selection bits

- 111 = Internal Fast RC (FRC) Oscillator divided by OSCCON<FRCDIV> bits
- 110 = Internal Fast RC (FRC) Oscillator divided by 16
- 101 = Internal Low-Power RC (LPRC) Oscillator
- 100 = Secondary Oscillator (Sosc)
- 011 = Primary Oscillator (Posc) with PLL module (XTPLL, HSPLL or ECPLL)
- 010 = Primary Oscillator (Posc) (XT, HS or EC)
- 001 = Internal Fast RC Oscillator with PLL module via Postscaler (FRCPLL)
- 000 = Internal Fast RC (FRC) Oscillator

bit 11 **Unimplemented**: Read as '0'

bit 10-8 **NOSC<2:0>**: New Oscillator Selection bits

- 111 = Internal Fast RC Oscillator (FRC) divided by OSCCON<FRCDIV> bits
- 110 = Internal Fast RC Oscillator (FRC) divided by 16
- 101 = Internal Low-Power RC (LPRC) Oscillator
- 100 = Secondary Oscillator (Sosc)
- 011 = Primary Oscillator with PLL module (XTPLL, HSPLL or ECPLL)
- 010 = Primary Oscillator (XT, HS or EC)
- 001 = Internal Fast Internal RC Oscillator with PLL module via Postscaler (FRCPLL)
- 000 = Internal Fast Internal RC Oscillator (FRC)

On Reset, these bits are set to the value of the FNOSC Configuration bits (DEVCFG1<2:0>).

bit 7 **CLKLOCK**: Clock Selection Lock Enable bit

If clock switching and monitoring is disabled (FCKSM<1:0> = 1x):

- 1 = Clock and PLL selections are locked
- 0 = Clock and PLL selections are not locked and may be modified

If clock switching and monitoring is enabled (FCKSM<1:0> = 0x):

Clock and PLL selections are never locked and may be modified.

bit 6 **ULOCK**: USB PLL Lock Status bit

- 1 = Indicates that the USB PLL module is in lock or USB PLL module start-up timer is satisfied
- 0 = Indicates that the USB PLL module is out of lock or USB PLL module start-up timer is in progress or USB PLL is disabled

bit 5 **SLOCK**: PLL Lock Status bit

- 1 = PLL module is in lock or PLL module start-up timer is satisfied
- 0 = PLL module is out of lock, PLL start-up timer is running or PLL is disabled

bit 4 **SLPEN**: Sleep Mode Enable bit

- 1 = Device will enter Sleep mode when a WAIT instruction is executed
- 0 = Device will enter Idle mode when a WAIT instruction is executed

bit 3 **CF**: Clock Fail Detect bit

- 1 = FSCM has detected a clock failure
- 0 = No clock failure has been detected

**Note:** Writes to this register require an unlock sequence. Refer to **Section 6. "Oscillator"** (DS60001112) in the *"PIC32 Family Reference Manual"* for details.

# PIC32MX5XX/6XX/7XX

1 = B-session end interrupt enabled

0 = B-session end interrupt disabled

bit 1 **Unimplemented:** Read as '0'

bit 0 **VBUSVDIE:** A-VBUS Valid Interrupt Enable bit

1 = A-VBUS valid interrupt enabled

0 = A-VBUS valid interrupt disabled

# PIC32MX5XX/6XX/7XX

## 12.1 Parallel I/O (PIO) Ports

All port pins have three registers (TRIS, LAT and PORT) that are directly associated with their operation.

TRIS is a Data Direction or Tri-State Control register that determines whether a digital pin is an input or an output. Setting a TRISx register bit = 1, configures the corresponding I/O pin as an input; setting a TRISx register bit = 0, configures the corresponding I/O pin as an output. All port I/O pins are defined as inputs after a device Reset. Certain I/O pins are shared with analog peripherals and default to analog inputs after a device Reset.

PORT is a register used to read the current state of the signal applied to the port I/O pins. Writing to a PORTx register performs a write to the port's latch, LATx register, latching the data to the port's I/O pins.

LAT is a register used to write data to the port I/O pins. The LATx Latch register holds the data written to either the LATx or PORTx registers. Reading the LATx Latch register reads the last value written to the corresponding PORT or Latch register.

Not all port I/O pins are implemented on some devices, therefore, the corresponding PORTx, LATx and TRISx register bits will read as zeros.

### 12.1.1 CLR, SET AND INV REGISTERS

Every I/O module register has a corresponding Clear (CLR), Set (SET) and Invert (INV) register designed to provide fast atomic bit manipulations. As the name of the register implies, a value written to a SET, CLR or INV register effectively performs the implied operation, but only on the corresponding base register and only bits specified as '1' are modified. Bits specified as '0' are not modified.

Reading SET, CLR and INV registers returns undefined values. To see the affects of a write operation to a SET, CLR or INV register, the base register must be read.

**Note:** Using a PORTxINV register to toggle a bit is recommended because the operation is performed in hardware atomically, using fewer instructions, as compared to the traditional read-modify-write method, as follows:

```
PORTC ^ = 0x0001;
```

### 12.1.2 DIGITAL INPUTS

Pins are configured as digital inputs by setting the corresponding TRIS register bits = 1. When configured as inputs, they are either TTL buffers or Schmitt Triggers. Several digital pins share functionality with analog inputs and default to the analog inputs at POR. Setting the corresponding bit in the AD1PCFG register = 1 enables the pin as a digital pin.

The maximum input voltage allowed on the input pins is the same as the maximum  $V_{IH}$  specification. Refer to **Section 32.0 “Electrical Characteristics”** for  $V_{IH}$  specification details.

**Note:** Analog levels on any pin that is defined as a digital input (including the ANx pins) may cause the input buffer to consume current that exceeds the device specifications.

### 12.1.3 ANALOG INPUTS

Certain pins can be configured as analog inputs used by the ADC and comparator modules. Setting the corresponding bits in the AD1PCFG register = 0 enables the pin as an analog input pin and must have the corresponding TRIS bit set = 1 (input). If the TRIS bit is cleared = 0 (output), the digital output level ( $V_{OH}$  or  $V_{OL}$ ) will be converted. Any time a port I/O pin is configured as analog, its digital input is disabled and the corresponding PORTx register bit will read '0'. The AD1PCFG register has a default value of 0x0000; therefore, all pins that share ANx functions are analog (not digital) by default.

### 12.1.4 DIGITAL OUTPUTS

Pins are configured as digital outputs by setting the corresponding TRIS register bits = 0. When configured as digital outputs, these pins are CMOS drivers or can be configured as open-drain outputs by setting the corresponding bits in the Open-Drain Configuration (ODCx) register.

The open-drain feature allows generation of outputs higher than  $V_{DD}$  (e.g., 5V) on any desired 5V tolerant pins by using external pull-up resistors. The maximum open-drain voltage allowed is the same as the maximum  $V_{IH}$  specification.

See the “**Device Pin Tables**” section for the available pins and their functionality.

### 12.1.5 ANALOG OUTPUTS

Certain pins can be configured as analog outputs, such as the CVREF output voltage used by the comparator module. Configuring the comparator reference module to provide this output will present the analog output voltage on the pin, independent of the TRIS register setting for the corresponding pin.

### 12.1.6 INPUT CHANGE NOTIFICATION

The input change notification function of the I/O ports (CNx) allows devices to generate interrupt requests in response to change-of-state on selected pin.

Each CNx pin also has a weak pull-up, which acts as a current source connected to the pin. The pull-ups are enabled by setting the corresponding bit in the CNPUE register.

**TABLE 12-7: PORTE REGISTER MAP FOR PIC32MX534F064H, PIC32MX564F064H, PIC32MX564F128H, PIC32MX575F256H, PIC32MX575F512H, PIC32MX664F064H, PIC32MX664F128H, PIC32MX675F256H, PIC32MX675F512H, PIC32MX695F512H, PIC32MX775F256H, PIC32MX775F512H AND PIC32MX795F512H DEVICES**

**Legend:** x = unknown value on Reset; — = unimplemented, read as '0'. Reset values are shown in hexadecimal.

- Note 1:** All registers in this table have corresponding CLR, SET and INV registers at their virtual addresses, plus offsets of 0x4, 0x8 and 0xC, respectively. See Section 12.1.1 “CLR, SET and INV Registers” for more information.
- 2:** These bits are not available on 64-pin devices.

## REGISTER 18-2: SPIxSTAT: SPI STATUS REGISTER

Bit Range	Bit 31/23/15/7	Bit 30/22/14/6	Bit 29/21/13/5	Bit 28/20/12/4	Bit 27/19/11/3	Bit 26/18/10/2	Bit 25/17/9/1	Bit 24/16/8/0
31:24	U-0	U-0	U-0	R-0	R-0	R-0	R-0	R-0
	—	—	—	RXBUFELM<4:0>				
23:16	U-0	U-0	U-0	R-0	R-0	R-0	R-0	R-0
	—	—	—	TXBUFELM<4:0>				
15:8	U-0	U-0	U-0	U-0	R-0	U-0	U-0	R-0
	—	—	—	—	SPIBUSY	—	—	SPITUR
7:0	R-0	R/W-0	R-0	U-0	R-1	U-0	R-0	R-0
	SRMT	SPIROV	SPIRBE	—	SPITBE	—	SPITBF	SPIRBF

<b>Legend:</b>	C = Clearable bit	HS = Set in hardware
R = Readable bit	W = Writable bit	U = Unimplemented bit, read as '0'
-n = Value at POR	'1' = Bit is set	'0' = Bit is cleared      x = Bit is unknown

- bit 31-29 **Unimplemented:** Read as '0'
- bit 28-24 **RXBUFELM<4:0>:** Receive Buffer Element Count bits (only valid when ENHBUF = 1)
- bit 23-21 **Unimplemented:** Read as '0'
- bit 20-16 **TXBUFELM<4:0>:** Transmit Buffer Element Count bits (only valid when ENHBUF = 1)
- bit 15-12 **Unimplemented:** Read as '0'
- bit 11 **SPIBUSY:** SPI Activity Status bit
  - 1 = SPI peripheral is currently busy with some transactions
  - 0 = SPI peripheral is currently idle
- bit 10-9 **Unimplemented:** Read as '0'
- bit 8 **SPITUR:** Transmit Under Run bit
  - 1 = Transmit buffer has encountered an underrun condition
  - 0 = Transmit buffer has no underrun condition

This bit is only valid in Framed Sync mode; the underrun condition must be cleared by disabling/re-enabling the module.
- bit 7 **SRMT:** Shift Register Empty bit (only valid when ENHBUF = 1)
  - 1 = When SPI module shift register is empty
  - 0 = When SPI module shift register is not empty
- bit 6 **SPIROV:** Receive Overflow Flag bit
  - 1 = A new data is completely received and discarded. The user software has not read the previous data in the SPIxBUF register.
  - 0 = No overflow has occurred

This bit is set in hardware; can only be cleared (= 0) in software.
- bit 5 **SPIRBE:** RX FIFO Empty bit (only valid when ENHBUF = 1)
  - 1 = RX FIFO is empty (CRPTR = SWPTR)
  - 0 = RX FIFO is not empty (CRPTR ≠ SWPTR)
- bit 4 **Unimplemented:** Read as '0'
- bit 3 **SPITBE:** SPI Transmit Buffer Empty Status bit
  - 1 = Transmit buffer, SPIxTXB is empty
  - 0 = Transmit buffer, SPIxTXB is not empty

Automatically set in hardware when SPI transfers data from SPIxTXB to SPIxSR.  
Automatically cleared in hardware when SPIxBUF is written to, loading SPIxTXB.
- bit 2 **Unimplemented:** Read as '0'

-n = Value at POR

'1' = Bit is set

'0' = Bit is cleared

x = Bit is unknown

bit 31-7 **Unimplemented:** Read as '0'

bit 6-0 **B2BIPKTGP<6:0>:** Back-to-Back Interpacket Gap bits

This is a programmable field representing the nibble time offset of the minimum possible period between the end of any transmitted packet, to the beginning of the next. In Full-Duplex mode, the register value should be the desired period in nibble times minus 3. In Half-Duplex mode, the register value should be the desired period in nibble times minus 6. In Full-Duplex the recommended setting is 0x15 (21d), which represents the minimum IPG of 0.96  $\mu$ s (in 100 Mbps) or 9.6  $\mu$ s (in 10 Mbps). In Half-Duplex mode, the recommended setting is 0x12 (18d), which also represents the minimum IPG of 0.96  $\mu$ s (in 100 Mbps) or 9.6  $\mu$ s (in 10 Mbps).

**Note:** Both 16-bit and 32-bit accesses are allowed to these registers (including the SET, CLR and INV registers). 8-bit accesses are not allowed and are ignored by the hardware.

# PIC32MX5XX/6XX/7XX

## REGISTER 25-28: EMAC1MAXF: ETHERNET CONTROLLER MAC MAXIMUM FRAME LENGTH REGISTER

Bit Range	Bit 31/23/15/7	Bit 30/22/14/6	Bit 29/21/13/5	Bit 28/20/12/4	Bit 27/19/11/3	Bit 26/18/10/2	Bit 25/17/9/1	Bit 24/16/8/0
31:24	U-0	U-0	U-0	U-0	U-0	U-0	U-0	U-0
	—	—	—	—	—	—	—	—
23:16	U-0	U-0	U-0	U-0	U-0	U-0	U-0	U-0
	—	—	—	—	—	—	—	—
15:8	R/W-0	R/W-0	R/W-0	R/W-0	R/W-0	R/W-1	R/W-0	R/W-1

7:0	R/W-1	R/W-1	R/W-1	R/W-0	R/W-1	R/W-1	R/W-1	R/W-0
	MACMAXF<7:0> <sup>(1)</sup>							

### Legend:

R = Readable bit

W = Writable bit

U = Unimplemented bit, read as '0'

-n = Value at POR

'1' = Bit is set

'0' = Bit is cleared

x = Bit is unknown

bit 31-16 **Unimplemented:** Read as '0'

bit 15-0 **MACMAXF<15:0>:** Maximum Frame Length bits<sup>(1)</sup>

These bits reset to 0x05EE, which represents a maximum receive frame of 1518 octets. An untagged maximum size Ethernet frame is 1518 octets. A tagged frame adds four octets for a total of 1522 octets. If a shorter/longer maximum length restriction is desired, program this 16-bit field.

**Note 1:** If a proprietary header is allowed, this bit should be adjusted accordingly. For example, if 4-byte headers are prepended to frames, MACMAXF could be set to 1527 octets. This would allow the maximum VLAN tagged frame plus the 4-byte header.

**Note:** Both 16-bit and 32-bit accesses are allowed to these registers (including the SET, CLR and INV registers). 8-bit accesses are not allowed and are ignored by the hardware.

### Legend:

R = Readable bit

W = Writable bit

U = Unimplemented bit, read as '0'

-n = Value at POR

'1' = Bit is set

'0' = Bit is cleared

x = Bit is unknown

bit 31-2 **Unimplemented:** Read as '0'

bit 1 **SCAN:** MII Management Scan Mode bit

1 = The MII Management module will perform read cycles continuously (for example, useful for monitoring the Link Fail)

0 = Normal Operation

bit 0 **READ:** MII Management Read Command bit

1 = The MII Management module will perform a single read cycle. The read data is returned in the EMAC1MRDD register

0 = The MII Management module will perform a write cycle. The write data is taken from the EMAC1MWTD register

**Note:** Both 16-bit and 32-bit accesses are allowed to these registers (including the SET, CLR and INV registers). 8-bit accesses are not allowed and are ignored by the hardware.

NOTES:

## APPENDIX A: MIGRATING FROM PIC32MX3XX/4XX TO PIC32MX5XX/6XX/7XX DEVICES

This appendix provides an overview of considerations for migrating from PIC32MX3XX/4XX devices to the PIC32MX5XX/6XX/7XX family of devices. The code developed for the PIC32MX3XX/4XX devices can be ported to the PIC32MX5XX/6XX/7XX devices after making the appropriate changes outlined below.

### A.1 DMA

PIC32MX5XX/6XX/7XX devices do not support stopping DMA transfers in Idle mode.

### A.2 Interrupts

PIC32MX5XX/6XX/7XX devices have persistent interrupts for some of the peripheral modules. This means that the interrupt condition for these peripherals must be cleared before the interrupt flag can be cleared.

For example, to clear a UART receive interrupt, the user application must first read the UART Receive register to clear the interrupt condition and then clear the associated UxIF flag to clear the pending UART interrupt. In other words, the UxIF flag cannot be cleared by software until the UART Receive register is read.

Table A-1 outlines the peripherals and associated interrupts that are implemented differently on PIC32MX5XX/6XX/7XX versus PIC32MX3XX/4XX devices.

In addition, on the SPI module, the IRQ numbers for the receive done interrupts were changed from 25 to 24 and the transfer done interrupts were changed from 24 to 25.

**TABLE A-1: PIC32MX3XX/4XX VERSUS PIC32MX5XX/6XX/7XX INTERRUPT IMPLEMENTATION DIFFERENCES**

Module	Interrupt Implementation
Input Capture	To clear an interrupt source, read the Buffer Result (ICxBUF) register to obtain the number of capture results in the buffer that are below the interrupt threshold (specified by ICI<1:0> bits).
SPI	Receive and transmit interrupts are controlled by the SRXISEL<1:0> and STXISEL<1:0> bits, respectively. To clear an interrupt source, data must be written to, or read from, the SPIxBUF register to obtain the number of data to receive/transmit below the level specified by the SRXISEL<1:0> and STXISEL<1:0> bits.
UART	TX interrupt will be generated as soon as the UART module is enabled. Receive and transmit interrupts are controlled by the URXISEL<1:0> and UTXISEL<1:0> bits, respectively. To clear an interrupt source, data must be read from, or written to, the UxRXREG or UxTXREG registers to obtain the number of data to receive/transmit below the level specified by the URXISEL<1:0> and UTXISEL<1:0> bits.
ADC	All samples must be read from the result registers (ADC1BUFx) to clear the interrupt source.
PMP	To clear an interrupt source, read the Parallel Master Port Data Input/Output (PMDIN/PMDOUT) register.
